

Weather Report

27 August 2019

South Africa - Weather

- Free State and neighboring areas will remain dry during the next two weeks
- Although winter wheat will remain dormant or semi-dormant, the warmer biased conditions could bring some of the wheat out of dormancy in the coming weeks
- Wheat growth prospects will be poor in the coming weeks
- Significant rain will be needed later in September to improve winter wheat prospects
- Dryness will persist for Western Cape during the next two weeks as well
- The region will need to see significant rain later in September to support better winter wheat conditions
- Temperatures will be near to below normal in the western half of South Africa this week while areas further east warm to near or above average levels

United States of America - Weather

U.S. MIDWEST: The bottom line to the two-week outlook has not changed since late last week and after rain comes to an end Tuesday, a period of drier weather will begin Wednesday and will continue through at least Sep. 9, but soil moisture will be high enough going into the period of drier weather to support the needs of crops in nearly all of the Midwest.

U.S. DELTA AND SOUTHEAST: Daily rounds of showers and thunderstorms will continue during the next two weeks in the Delta and the Southeast and enough rain should fall to maintain mostly favorable soil conditions across the region.

o There will be interruptions to early harvesting, but fieldwork should advance around the showers and thunderstorms.

South America - Weather

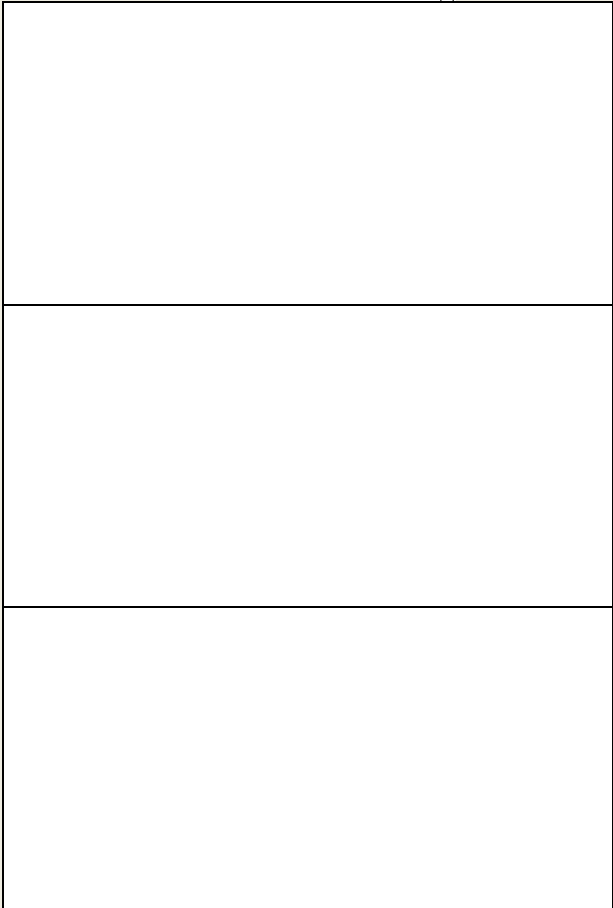

BRAZIL: Today's forecast is wetter for far southern Brazil with some areas from Mato Grosso do Sul into Parana seeing rain as well, but rain there should not be great enough to induce significant increases in soil moisture and greater rain will be needed to improve conditions for planting.

ARGENTINA: Argentina will continue to see a restricted rainfall pattern most often through the next two weeks and western Argentina will remain in need of greater rain to improve conditions for winter wheat.

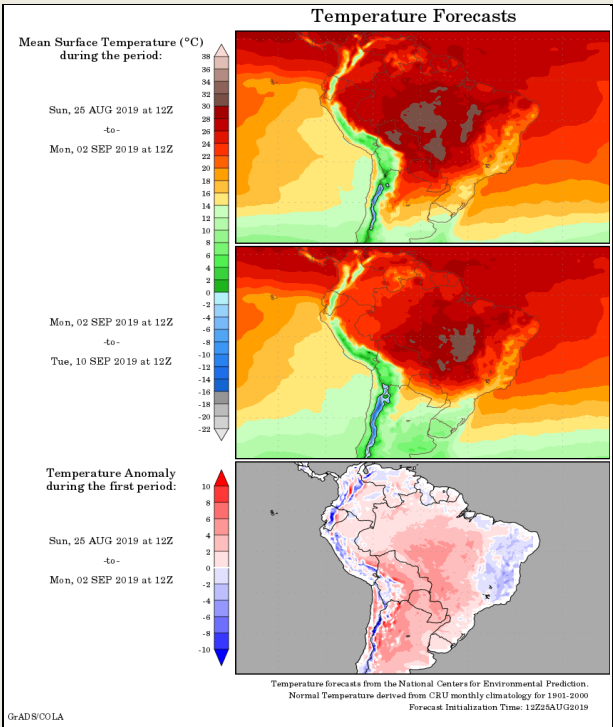

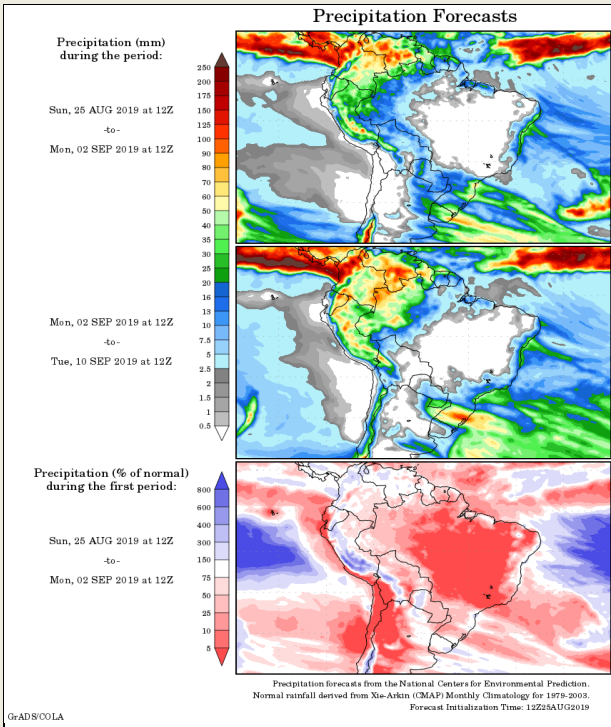

o Some showers will occur on occasion with most of those showers occurring outside of western Argentina where a further depletion of soil moisture is expected.

Europe, New Zealand and Australia - Weather

EUROPE: Restricted precipitation will occur throughout most of the Europe this coming week. The drying will promote good conditions for fieldwork, but will continue to raise concern over portions of France, especially locations that have missed recent rainfall, as well as Serbia, Hungary, Romania and Bulgaria. Conditions will not be completely dry, but most locations will receive totals no more than 0.45 inch and dry weather will continue in the far southeast.

AUSTRALIA: Drying will continue over east-central Australia into western New South Wales and interior South Australia and a small portion of northwest Victoria for at least the next ten days to two weeks. Northern winter crop production areas have struggled due to dryness. Concern over serious deficits in long term water supply will prevail and greater rainfall will eventually be needed to bolster soil moisture for spring and summer crops or production issues will continue. Early season planting can usually begin in September, but farmers will wait until moisture returns most likely as there is plenty of time left to plant.
