

Weather Report

12 August 2020

South Africa - Weather

- Western South Africa will see a mix of erratic precipitation and sunshine during the next two weeks
- o Western Cape will see the most widespread rain that will slightly bolster soil moisture at times
- Rainfall in Western Cape during the next two weeks will be beneficial for the winter wheat o Many areas will not receive enough rain to significantly impact long-term soil conditions and additional rain would still be welcome
- o Winter wheat development conditions will either improve marginally or remain favorable
- o However, a few fields may remain a little too dry for ideal growth
- o The small amount of rain-fed winter wheat in Free State and neighboring areas will be too dry to support aggressive growth in the next two weeks
- o Significant rain is needed to improve the moisture profile and support a better environment for the crops
- o Irrigated crops will develop under more favorable conditions in Free State, Northern Cape, and neighboring areas, though most locations would still welcome a good shot of rain

United States of America - Weather

U.S. MIDWEST: The bottom line to the two-week outlook remains favorable for crops in much of the Midwest as rain through Sunday should boost soil moisture enough in the driest areas to improve conditions for crops while rain elsewhere should be great enough to ensure crops have enough adequate soil moisture when a period of drier weather begins next week. Although much of the Midwest will dry down significantly Monday through Aug. 25, subsoil moisture should be adequate to allow most corn to develop favorably to maturity and if rain returns during the last week of the month soybean yields should not be impacted significantly by drying Monday through Aug. 25.

U.S. DELTA AND SOUTHEAST: A timely increase in showers and thunderstorms will occur in the Delta and the Southeast today through Friday bringing relief from dryness to the many areas from the Delta through Alabama and parts of Georgia that have become short of soil moisture. Temperatures will be hot enough, however, that improvements in soil moisture and crop conditions should be temporary as much of the moisture will quickly be lost to evaporation after it falls. Rain through Friday will be nearly widespread with a wide range of rainfall totals varying from 0.35-2.0" with some bands of heavy rain.

South America - Weather

BRAZIL: Showers and thunderstorms will increase in Paraguay and southern Brazil today and will continue daily through Aug. 20 bringing enough rain to slow fieldwork while inducing significant increases in soil moisture that will be beneficial for early corn planting, once the soil dries down enough for fieldwork to occur. Rain through Thursday will be greatest from central and southern Paraguay through southern Parana, Santa Catarina, and central and northern Rio Grande do Sul where totals will be 0.60-2.0" and locally more with lighter rain extending into the remainder of Rio Grande do Sul and little rain further north.

ARGENTINA: A restricted rainfall pattern will continue through the next two weeks across Argentina and western Argentina will remain in need of rain to improve conditions for winter wheat as well as increase soil moisture for the coming summer crop planting season.

o A temporary increase in rain will occur in northern Corrientes Tuesday into Wednesday where most areas will see 0.30-1.0" of rain and locally more.

Europe, New Zealand and Australia - Weather

EUROPE: Rain will return to northern Spain, France, the U.K. into Germany this week helping relieve recent hot and dry conditions. Rainfall will be sufficient to help bolster topsoil moisture and relieve recent stress due to the hot and dry weather. With that said, hot temperatures will prevail over western Europe the next couple of days before cooling down late this workweek through the remainder of the coming seven days.

AUSTRALIA: Additional beneficial rain will occur over eastern winter crop production areas during the coming week to ten days. The moisture will supply beneficial moisture for winter wheat, barley and canola as greater crop growth returns later this month into September. Rain this week will be light and erratic over South Australia into Victoria and surrounding areas of New South Wales through Wednesday. An increase in rain will return to southeastern into east-central Australia Thursday into Friday. Nearly widespread moisture will occur over New South Wales into southern Queensland. Light rain showers and thunderstorms will linger into the weekend, especially near the southern and eastern coast into the weekend.
