

Weather Report

14 August 2020

South Africa - Weather

- Western South Africa will see a mix of erratic precipitation and sunshine during the next two weeks
- Precipitation will generally be too light to impact long-term soil conditions through the end of next week
- The periods of erratic rain in Western Cape will be beneficial for the winter wheat during the next two weeks
- Precipitation will be too light to significantly bolster soil moisture, at least during the next seven days
- Winter wheat development conditions may improve marginally after many areas dried down in recent weeks
- However, several fields may remain a little too dry for ideal growth
- Timely rain during the second week may help bolster soil moisture
- The small amount of rain-fed winter wheat in Free State and neighboring areas will be too dry to support aggressive growth in the next two weeks
- Significant rain is needed to improve the moisture profile and support a better environment for the crops
- Irrigated crops will develop under more favorable conditions in Free State, Northern Cape, and neighboring areas, though most locations would still welcome a good shot of rain

United States of America - Weather

U.S. MIDWEST: Although a large part of the Midwest will dry down significantly during the next two weeks most crops should continue to develop favorably as subsoil moisture is high enough to support the needs of crops, but there will be some exceptions in the drier areas where stress should increase and soybean yields may decline. The driest areas extend from northeastern Nebraska and southeastern South Dakota to central Iowa with another dry area extending from northeastern Illinois to southern Michigan and northern Ohio. Soil moisture elsewhere should be high enough to favorably support corn to maturity while rain will be needed in many areas in the last week of the month to maintain the highest possible production potentials for soybeans

U.S. DELTA AND SOUTHEAST: Timely showers and thunderstorms will continue in the Delta and the Southeast through Saturday bringing relief from dryness to the many areas from the Delta through Alabama and parts of Georgia that have become short of soil moisture. Temperatures will be warm enough, however, that improvements in soil moisture and crop conditions should be temporary as much of the moisture will quickly be lost to evaporation after it falls.

South America - Weather

BRAZIL: Showers and thunderstorms will occur in Paraguay and southern Brazil daily through next Thursday bringing enough rain to slow fieldwork while inducing significant increases in soil moisture that will be beneficial for early corn planting, once the soil dries down enough for fieldwork to occur.

ARGENTINA: A restricted rainfall pattern will continue through the next two weeks across Argentina and western areas will remain in need of rain to improve conditions for winter wheat as well as increase soil moisture for the coming summer crop planting season.

o A few showers will occur on occasion with Corrientes and southeastern Buenos Aires wettest. High temperatures today and Friday will be in the upper 50s through the lower 70s with some middle 50s in the south Friday and some middle 70s to the lower 80s in the north Friday.

Europe, New Zealand and Australia - Weather

EUROPE: Rain will return to northern Spain, France, the U.K. into Germany this week helping relieve recent hot and dry conditions. Rainfall will be sufficient to help bolster topsoil moisture and relieve recent stress due to the hot and dry weather. With that said, hot temperatures will prevail over western Europe the next couple of days before cooling down late this workweek through the remainder of the coming seven days.

AUSTRALIA: Additional beneficial rain will occur over winter crop production areas during the coming week to ten days. The moisture will supply beneficial moisture for winter wheat, barley and canola as greater crop growth returns later this month into September. An increase in rain will return to southeastern into east-central Australia today into Friday. Nearly widespread moisture will occur over New South Wales into southeastern Queensland and Victoria. Light rain will linger near the southeastern coast into the weekend.
