

Weather Report

18 August 2020

South Africa - Weather

The periods of erratic rain in Western Cape will only offer minor relief from the dryness during the next two weeks

- o Most areas will not receive enough rain to reverse the moisture deficits
- o Winter wheat development conditions will still be mostly favorable despite the lack of significant rain
- o A good shot of rain would still be welcome to maintain aggressive growth
- o The small amount of rain-fed winter wheat in Free State and neighboring areas will be too dry to support aggressive growth in the next two weeks
- o Significant rain is needed to improve the moisture profile and support a better environment for the crops
- o Irrigated crops will develop under more favorable conditions in Free State, Northern Cape, and neighboring areas, though most locations would still welcome a good shot of rain

United States of America - Weather

U.S. MIDWEST: Many areas across the Midwest will dry down significantly during the next two weeks and soybean yields may not be quite as high as what would occur if greater rain were to fall, but most areas have enough subsoil moisture in place to support crops to maturity without crop yields being seriously affected by the drying. There will be some exceptions in the drier areas where the soil is dry enough that soybean yields should decline, but major declines in yield potentials do not appear likely and mild temperatures during the next week will help to prevent rapid increases in crop stress.

U.S.

DELTA AND SOUTHEAST: A restricted rainfall pattern will occur through the next ten days to two-weeks from the Delta into western and northern Alabama and stress to crops should increase in the drier areas once moisture from recent rain is lost to evaporation. A few showers will occur on occasion through the next ten days with the resulting rain not likely to be great enough to have much of an impact on soil or crop conditions. The next chance for organized rain may occur Aug. 30-31, but confidence for this rain event is low. Regular rounds of showers will occur from southern into eastern Alabama and northern Florida through Georgia and into the Carolinas and southern Virginia where soil moisture will be supportive of crop development.

South America - Weather

BRAZIL: Showers and thunderstorms will occur in Paraguay and southern Brazil daily through Thursday bringing enough rain to slow fieldwork while inducing significant increases in soil moisture that will be beneficial for early corn planting, once the soil dries down enough for fieldwork to occur. Rain today will be greatest from central and southern Paraguay through southern Parana, Santa Catarina, and northern central Rio Grande do Sul where totals will be 0.40-1.50" and locally more with lighter rain in nearby areas.

ARGENTINA: A restricted rainfall pattern will continue through the next two weeks across Argentina and western areas will remain in need of rain to improve conditions for winter wheat as well as increase soil moisture for the coming summer crop planting season.

o A few showers will occur on occasion with Corrientes and southern Buenos Aires wettest.

Europe, New Zealand and Australia - Weather

EUROPE: Rain will be sufficient to bolster topsoil moisture and relieve stress in France, the U.K., Belgium into Germany this week easing recent dryness. The moisture will be welcome and help provide necessary moisture for crop development. Cooler temperatures will also accompany the rain helping ease stress as well.

AUSTRALIA: Additional beneficial rain will occur over winter crop production areas during the coming week to ten days. The moisture will supply beneficial moisture for winter wheat, barley and canola as greater crop growth returns later this month into September. With that said, any additional precipitation in northwestern New South Wales and southwestern Queensland will be brief and erratic.

o An increase in rain will return to New South Wales and southeastern Queensland today.
