

Weather Report

24 February 2021

South Africa - Weather

A large section of South Africa's coarse grain and oilseed production areas will see a good mix of rain and sunshine during the coming week. The only exceptions will be in portions of Northern Cape that receive little to no rain. The environment will remain favorable for aggressive development outside the driest areas in Northern Cape. Fieldwork may be sluggish during the wettest periods.

United States of America - Weather

U.S. MIDWEST: The Midwest will see a relatively quiet weather pattern through Thursday before regular rounds of mostly light precipitation impact parts of the region Friday into Mar. 6. The lower Midwest will be wettest overall while the far northwestern Corn Belt is driest. Temperatures will be warmer than normal most often through late next week with a brief period of cooler than usual conditions in parts of the region early next week.

o Significant melting of snow will continue this week and the lower Midwest as well as eastern Nebraska and eastern South Dakota will be snow-free during the next day or two.

U.S. DELTA AND SOUTHEAST: Rain will not be evenly distributed and the central and northern Delta through northern Georgia and into North Carolina and southern Virginia will be wettest and some heavy rain is likely, especially in the northern Delta where some flooding may occur. The southern Delta to southern Georgia, southern South Carolina, and northern Florida will see rain, but the rain should be light enough that some early season fieldwork advances around the precipitation.

South America - Weather

BRAZIL: The resulting rain will slow harvesting of soybeans and planting of second season corn as well as threatening some soybeans with quality declines while the moisture is supportive of developing crops. Some fieldwork should advance around the rain with central and southern Mato Grosso and northern Mato Grosso do Sul seeing good opportunities for fieldwork through Thursday when rain is light and infrequent enough that good harvest progress should be made before rain increases Friday.

ARGENTINA: Much of Argentina will see warm to hot temperatures and little rain through at least the middle of next week and pockets of crop stress are likely to expand, but soil moisture in place today and some additional rain in the north into Thursday should prevent most crops from becoming seriously stressed right away.

Europe, New Zealand and Australia - Weather

EUROPE: A restricted precipitation pattern will occur over a large portion of the European Continent during the coming week to ten days. Very little moisture will impact most of France, Italy and Germany into eastern Europe and southern Scandinavia and some locations will remain completely dry. Drying during the next ten days will increase the need for rainfall to return in March, but crops will continue to be supported from current soil moisture.

AUSTRALIA: Scattered showers and thunderstorms will impact southeastern Queensland into eastern New South Wales this week and help support summer crop development. The greatest rain will occur in coastal areas of northeastern New South Wales into a few surrounding interior areas where amounts will vary from 2.00 to 4.00 inches and locally greater amounts. In the meantime, moisture totals elsewhere will vary from 0.50 to 1.50 inches and local totals exceeding 2.00 inches.

Southwestern Queensland and western New South Wales into Victoria and southeastern South Australia summer crop areas will remain dry this week and crop moisture stress will continue to increase.
