

Weather Report

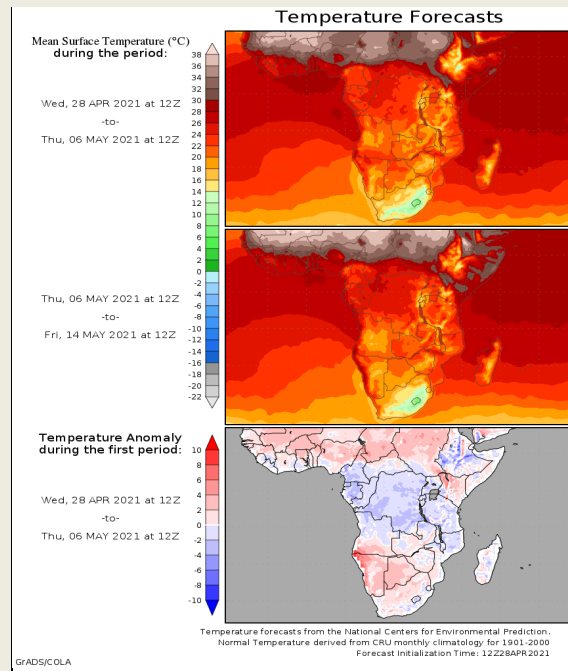

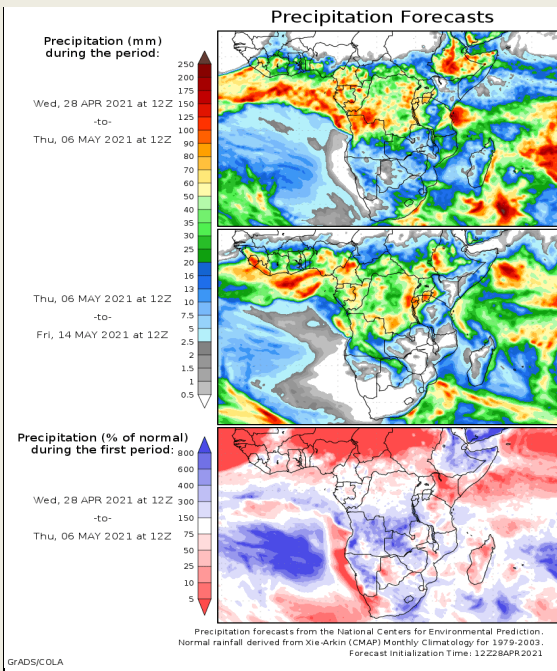

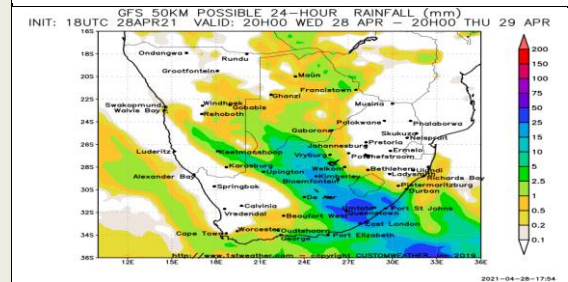

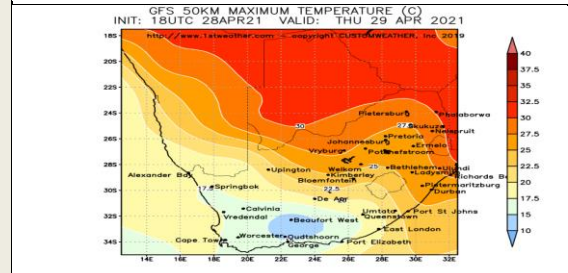

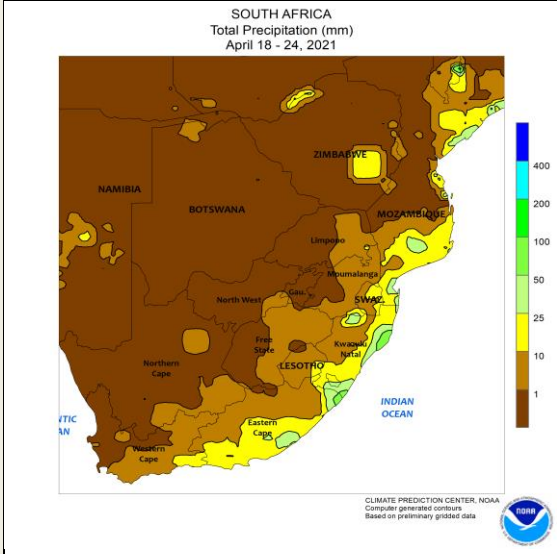

29 April 2021

South Africa - Weather

Eastern and central South Africa's main coarse grain and oilseed areas will have opportunities for rain through the middle of next week. The precipitation will be enough to slow or delay harvesting, though no major crop quality impacts are expected. Producers will still have a few opportunities to get into the fields between rain events. • South Africa will see a mix of rain and sunshine through the middle of next week

- o A slow-moving frontal boundary will bring erratic rain to the country today into Saturday
- o Light shower activity will also occur later this weekend into the first part of next week for western South Africa
- o Natal, Eastern Cape, Free State, and North West will receive 0.75-3.00" of rain by next Wednesday morning
- o Other areas will receive 0.10-0.75" of rain with portions of southern and western Mpumalanga receiving up to 1.50" of moisture

• South Africa will again see a mix of mostly light rain and sunshine May 6 – 12

United States of America - Weather

U.S. MIDWEST: The Midwest will see two rounds of significant rain and interruptions to planting during the next week while most areas will benefit from the increases in soil moisture that result with the driest areas in the northwestern Corn Belt missing much of the significant rainfall. The remainder of the Midwest will be left with mostly favorable soil conditions through the next two weeks with mostly minor interruptions to fieldwork from each round of rain with a few exceptions.

U.S. DELTA AND SOUTHEAST: Today's forecast is drier from southern Georgia to the Carolinas and southern Virginia and much of the region will be dry through this weekend and will see good planting progress before rain returns next week. Most areas from the Delta through Alabama and northern Georgia will see 1 to 2 more days of dry weather and improving conditions for planting before rain increases Thursday into Friday. Drier weather will return May 6-9 and planting should gradually increase with the next storm system possible May 10-11.

South America - Weather

BRAZIL: Dry and favorable conditions for fieldwork will be most common in much of Brazil and Paraguay through the next two weeks and although there will be opportunities for rain in most areas, the rain may not be great enough to prevent increasing levels of stress to second season corn in many areas.

o Second season corn from northern Parana to Sao Paulo and Goias should see increasing crop stress during the next two weeks as the soil dries out and little to no rain of significance is expected.

ARGENTINA: Conditions for crop maturation and harvesting will be mostly favorable through the next two weeks as only one round of significant rain is expected with that event occurring Sunday into Tuesday and the moisture beneficial for immature crops.

o Cotton in northeastern Argentina should be discolored by the rain, but with drier weather expected to follow the fibers should be bleached white.

Europe, New Zealand and Australia - Weather

EUROPE: Recent drying has occurred over France and the U.K. into Germany and Scandinavia allowing for improvements in planting and crop development in France with warming late last week into the weekend and will continue throughout this week. Warming will also expand into Germany during the middle of this week and frost and freezes will diminish late this week into the weekend.

AUSTRALIA: Restricted precipitation and net drying will occur over most of Australia's major agricultural regions during the coming week. An increase in rain is needed to support winter wheat, barley and canola planting and production totals, but there is still plenty of time for rain to occur with planting occurring into late May and June normally. The lack of moisture will continue to support favorable conditions for maturation and harvest of sorghum and cotton. Rain showers will increase over the lower coast of Western Australia Wednesday into Friday

Moisture totals will vary from 0.10 to 0.80 inch and local totals exceeding 1.00 inch in a small portion of Western Australia's crop areas. Otherwise, mostly dry weather will prevail.
