

Weather Report

30 April 2021

South Africa - Weather

South Africa will see a mix of rain and sunshine during the coming week. The periods of rain will likely slow the coarse grain and oilseed harvest at times, most notably in Free, State, North West, and Natal. Producers will still have opportunities to get into the fields between rain events and no quality impacts are expected for the crops still in the ground.

- South Africa will see a mix of rain and sunshine during the coming week
- o A slow-moving frontal boundary will bring erratic rain to the country today Friday with showers lingering in eastern South Africa Saturday
- o Another disturbance will generate erratic rainfall in Western Cape, Northern Cape, and neighboring areas toward the middle of next week
- o Natal and Eastern Cape will receive 1.00-3.00" of rain with locally greater amounts by next Thursday morning
- o Free State and North West will generally receive 0.75-2.00" of rain
- o Other areas will receive 0.25-1.50" of rain
- South Africa will only have a few opportunities for light rain May 7 – 13

United States of America - Weather

U.S. MIDWEST: A mix of rain and sunshine will occur during the next two weeks allowing planting to advance around the rain with enough rain from southwestern to eastern areas to maintain favorable soil moisture while west-central into northern parts of the western Corn Belt are not likely to receive enough rain to prevent continued drying.

U.S. DELTA AND SOUTHEAST: Large parts of Alabama and northern Florida through Georgia to the Carolinas and southern Virginia will be dry through this weekend and will see good planting progress before rain returns Sunday evening. Most of the Delta through southern Mississippi will see rain today into Friday with the moisture good for the remaining dry pockets in the region.

o Rain Sunday through Wednesday will be significant from the Delta to Alabama and central and northern Georgia and planting will be slow to resume with the moisture welcome in the drier areas.
o Drier weather will return May 6-9 and planting should gradually increase with the next storm system possible May 10-11.

South America - Weather

BRAZIL: Dry and favorable conditions for fieldwork will be most common in much of Brazil and Paraguay through the next two weeks and although there will be opportunities for rain in most areas, the rain may not be great enough to prevent increasing levels of stress to second season corn in many areas.

o Second season corn from northern Parana to Sao Paulo and Goias should see increasing crop stress during the next two weeks as the soil dries out and little to no rain of significance is expected.

ARGENTINA: Conditions for crop maturation and harvesting will be mostly favorable through the next two weeks as only one round of significant rain is expected with that event occurring Sunday into Tuesday and the moisture beneficial for immature crops.

o Cotton in northeastern Argentina should be discolored by the rain, but with drier weather expected to follow the fibers should be bleached white.

Europe, New Zealand and Australia - Weather

EUROPE: Recent drying has occurred over France and the U.K. into Germany and Scandinavia allowing for improvements in planting and crop development in France with warming late last week into the weekend and will continue throughout this week. Warming will also expand into Germany during the middle of this week and frost and freezes will diminish late this week into the weekend.

AUSTRALIA: Restricted precipitation and net drying will occur over most of Australia's major agricultural regions during the coming week. An increase in rain is needed to support winter wheat, barley and canola planting and production totals, but there is still plenty of time for rain to occur with planting occurring into late May and June normally. The lack of moisture will continue to support favorable conditions for maturation and harvest of sorghum and cotton. Rain showers will increase over the lower coast of Western Australia Wednesday into Friday

Moisture totals will vary from 0.10 to 0.80 inch and local totals exceeding 1.00 inch in a small portion of Western Australia's crop areas. Otherwise, mostly dry weather will prevail.
