22 June 2021

South Africa - Weather

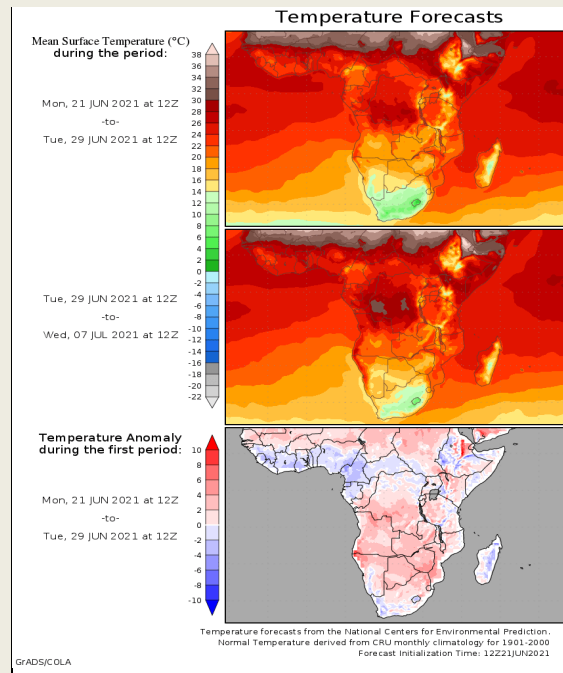

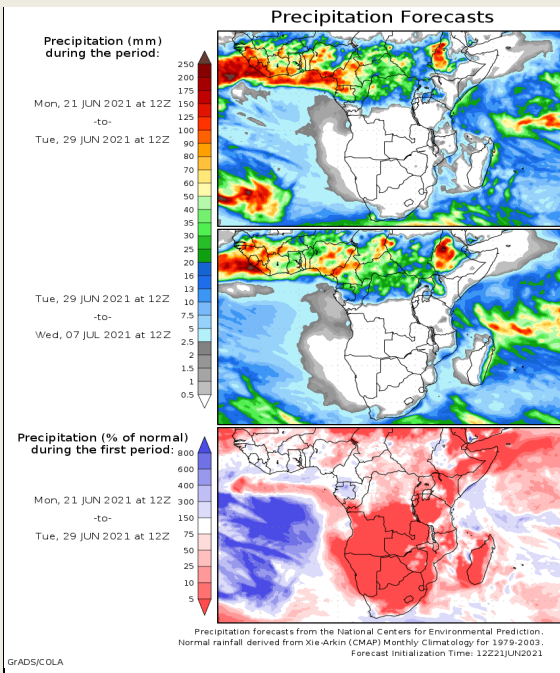

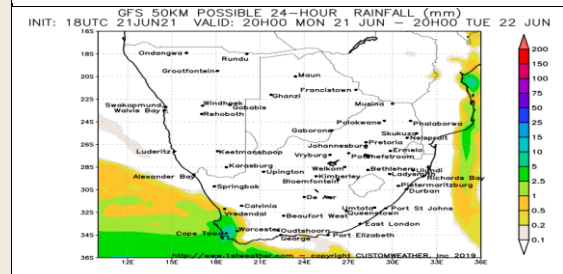

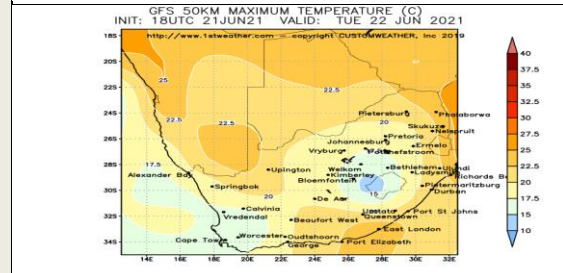

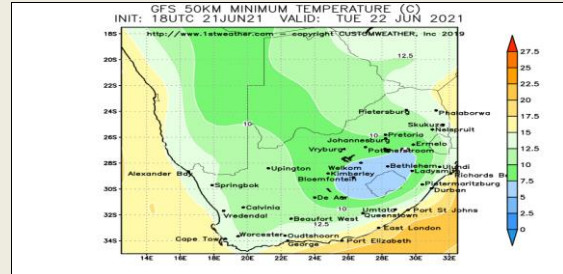

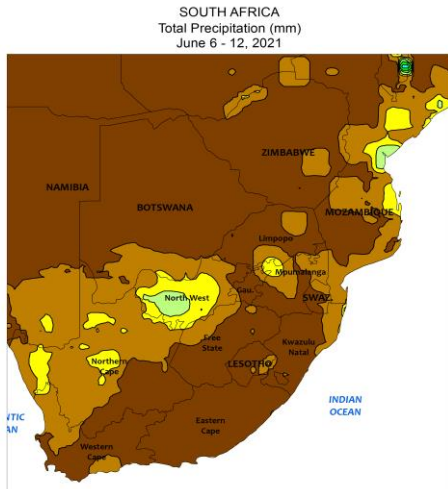

Southwestern Western Cape will see a mix of rain and sunshine this week while most other locations in South Africa are dry. The rain will be enough to slightly increase soil moisture in southwestern Western Cape that will help maintain a generally favorable environment for winter wheat growth. Other locations in Western Cape would welcome a boost in rain to support ideal wheat conditions. Irrigated winter wheat in Northern Cape and Free State will continue to develop under generally favorable conditions as well despite the lack of rain. Dryland wheat in Free State needs a significant boost in rain to improve establishment and growth. • South Africa will be mostly dry this week o However, two disturbances will bring erratic rain to Western Cape on a frequent basis through Saturday

☒ Southwestern Western Cape will receive 0.75-2.00" of rain and locally greater amounts by next Monday morning

☒ Other areas in Western Cape will receive 0.10-0.50" of rain

☒ Any rain that occurs elsewhere in South Africa will be too light to counter evaporation

• Drier biased conditions are slated for much of South Africa June 29 – July 5

United States of America - Weather

U.S. MIDWEST: Rain is still expected to fall in most of the Midwest during the coming week to ten days. Sufficient rain will fall to support crop development, although moisture deficits that have been greatest in the northwestern Corn Belt are unlikely to be fully relieved. Crop moisture stress will be quick to return in northwestern crop areas when warming resumes briefly during mid-week this week and more persistently during the Sunday through Wednesday period next week. The best crop conditions will be in the central and eastern Midwest. Some drying and warming is expected July 3-5.

U.S. DELTA AND SOUTHEAST: favorable mix of rain and sunshine is expected in the Delta and southeastern states through much of the next ten days to two weeks. A few pockets of dryness will be possible, but the majority of crop areas in these areas will have sufficient moisture to support most crop needs. Crop development will continue to advance well and production potentials for most crops will remain very good. In the meantime, Tropical depression Claudette failed to produce much damage to cotton, corn, soybeans or peanuts, despite some pockets of local flooding.

South America - Weather

BRAZIL: No change in the general theme of weather occurred during the weekend and no changes were expected this week. That leaves most northern Safrinha corn and cotton areas dry as well as northeastern Brazil. Rain is still expected periodically in the far south of the nation with just enough rain to keep wheat developing well. Safrinha corn filling, maturation and harvest will advance without much change in overall production or quality. Wheat conditions will remain better than usual.

ARGENTINA: Argentina will see dry weather most often during the next two weeks and good harvest progress should be made around a few rounds of mostly light showers while western Argentina will remain in need of greater rain to improve conditions for winter wheat.

- o Most days will be dry with a few light showers on occasion.
- o Light rain will increase from San Luis into Cordoba Wednesday into next Friday and many areas will receive up to 0.25" of rain and locally more.

Europe, New Zealand and Australia - Weather

EUROPE: Favorable soil moisture conditions will continue to be supported by periodic rain the next seven to ten days. Rounds of scattered rain will return to Europe during the middle of next week and replenish topsoil moisture throughout central portions of the continent. In the meantime, rounds of rainfall will be greatest in eastern portions of the continent from Poland and western Ukraine into Romania and Bulgaria.

AUSTRALIA: A good mixture of precipitation and sunshine will occur throughout most of Australia's major winter wheat, barley and canola production areas the next seven to ten days. With that said, a soaking of rain is needed in Queensland and interior northern New South Wales as well as interior southeastern South Australia to completely restore soil moisture, but any improvements will be welcome. Restricted precipitation will also occur in northern and interior production areas of Western Australia this week.
