# South Africa - Weather

Western Cape will continue to have opportunities for rain through the end of next week. Many areas in the west and southwest will receive enough rain to gradually bolster soil moisture. Winter wheat conditions will remain favorable for much of crop country, though eastern fringes of the wheat areas may need a little more rain for ideal conditions.

Free State and neighboring areas in Northern Cape will remain mostly dry through the end of next week. Irrigated winter wheat areas will still see mostly favorable conditions despite the lack of rain. Rain-fed wheat will otherwise continue to develop poorly or unevenly. Western South Africa will have several opportunities for erratic rain during the coming week. Light rain will initially evolve today and Saturday. A frontal boundary will bring more widespread rain to the region Sunday and Monday with more precipitation occurring toward the middle of next week. Western sections of Western Cape and Northern Cape will receive 0.50-3.00" of rain with locally greater amounts by next Friday morning.

Other areas in Western Cape and southern Northern Cape will receive 0.10-0.50" of rain with locally greater amounts. The remaining portions of South Africa will be mostly dry through the end of next week. Any rain that does occur will be lost to evaporation.

# United States of America - Weather

**U.S. MIDWEST:** Frequent shower and thunderstorm activity in the first week of the outlook will notably raise soil moisture and cause fieldwork delays. The corridor of heaviest rainfall is expected from eastern Kansas into Ohio and southern Michigan and this is where flooding concerns are greatest. Some additional strong to severe thunderstorms will occur as well with locally large hail and damaging winds. The rain in the northwest, where soil moisture is lowest, will be beneficial; however, this part of the region will still be in need of more rain.

**U.S. DELTA AND SOUTHEAST:** Erratic rain in the first week of the outlook will leave pockets of both regions with a need for greater rainfall and some possible increase in crop stress but also leave pockets with favorable conditions. The Southeast is likely to be drier overall than the Delta, with the Carolinas and Virginia driest. Greater rainfall is still likely in both regions in the second week of the outlook which will be timely; though, a close monitoring of the rain distribution will be warranted.

# South America - Weather

**BRAZIL:** No change in the general theme of weather occurred overnight and no changes were expected this week. That leaves most northern Safrinha corn and cotton areas dry as well as northeastern Brazil. Rain is still expected periodically in the far south of the nation with some local flooding possible that may lead to a threat to winter wheat conditions and production. Safrinha corn filling, maturation and harvest will advance without much change in overall production or quality. Wheat conditions will remain better than usual.

There is some potential for wheat damage from freezing temperatures in southern Parana during mid-week next week. The crop should be in the pre-reproductive stage of development.

**ARGENTINA:** Good late season harvest weather and winter crop planting conditions are expected through the next two weeks. A few showers will occur from western Buenos Aires to San Luis, southern Cordoba and northern La Pampa today with rainfall to 0.35 inch

- Showers Saturday will be sporadic and very light in the far west-central and northwestern crop areas where less than 0.25 inch of rain will result

# Europe, New Zealand and Australia - Weather

**EUROPE:** Conditions will continue to trend wetter throughout Europe this week. Favorable conditions will occur throughout most of the Continent. However, southern areas from Portugal and Spain as well as southern Italy into the eastern Adriatic Sea Nations into parts of Hungary, Serbia and Greece will remain mostly dry and crop stress will continue.

**AUSTRALIA:** A restricted precipitation pattern will evolve over most of interior production areas of Australia's wheat, canola and barley this week. Greater rain is still needed in Queensland as well as southeastern South Australia into northwestern Victoria.

o With that said rain will linger over southeastern Queensland today and linger over the southeastern coast into Saturday.

▮ Additional daily moisture totals will vary from 0.10 to 0.80 inch and local totals in excess of 1.00 inch in eastern production areas of Queensland.
