# South Africa - Weather

Free State and neighboring areas will remain mostly dry through the middle of next week. Winter wheat establishment and growth conditions will remain poor in unirrigated areas until rain potentials increase. Western Cape will also be mostly dry through the middle of next week. Although winter wheat establishment and growth conditions will slowly deteriorate, there will be plenty of moisture to maintain a good environment for the crops during the next several days. A disturbance will continue to promote erratic rainfall for Natal, eastern sections of Eastern Cape, Mpumalanga, and neighboring areas today and Thursday. Other than a few isolated showers, no follow-up rain is expected through the middle of next week. Moisture totals by next Wednesday morning will range from 0.75-3.00" and locally greater amounts in southern Natal and eastern fringes of Eastern Cape. Other areas will receive 0.10-0.75" of rain.

- The remaining portions of South Africa will be mostly dry through the middle of next week
- Any rain that does occur will be lost to evaporation
- Much of South Africa will be drier than normal June 10 - 16

# United States of America - Weather

**U.S. MIDWEST:** The Midwest will see a warmer and drier weather pattern through the next two weeks and late planting should advance well while crop stress is likely to increase in the drier areas of the northwestern Corn Belt where little rain is expected through the next week and will see only one round of organized rain during the next two weeks. Most of the Midwest will be warmer than normal through the next week with the far northwest unseasonably warm Thursday into early next week where highs will reach the middle and some upper 90s Friday and Saturday.

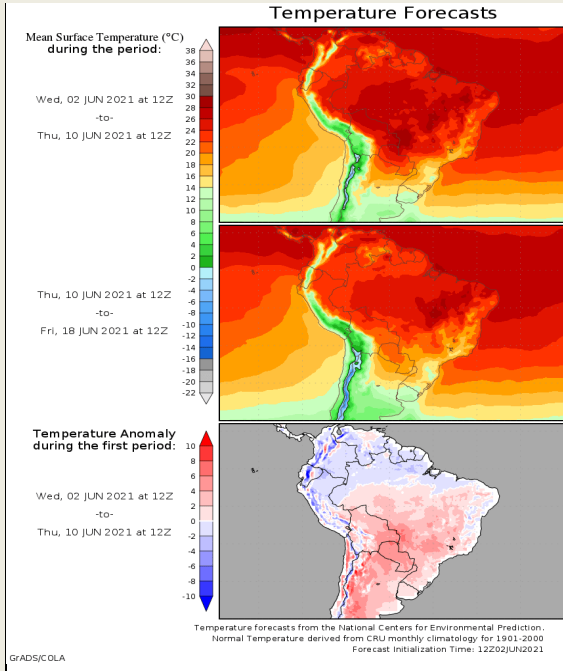

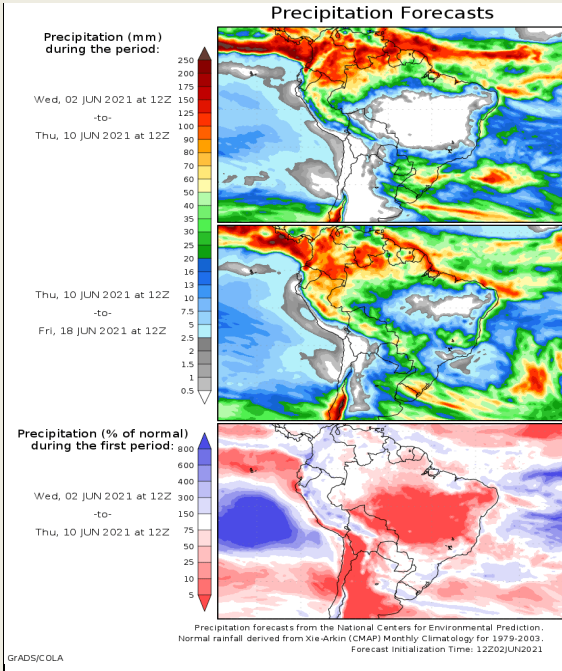

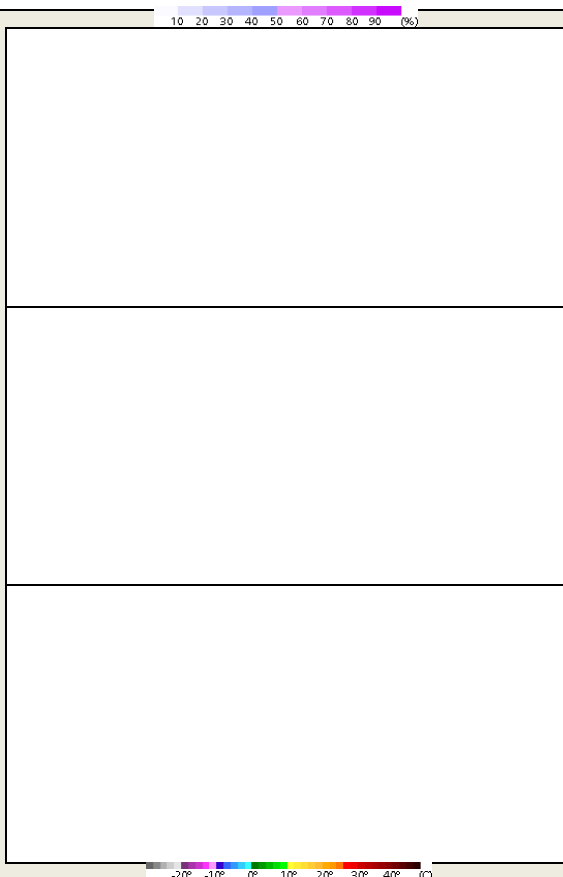

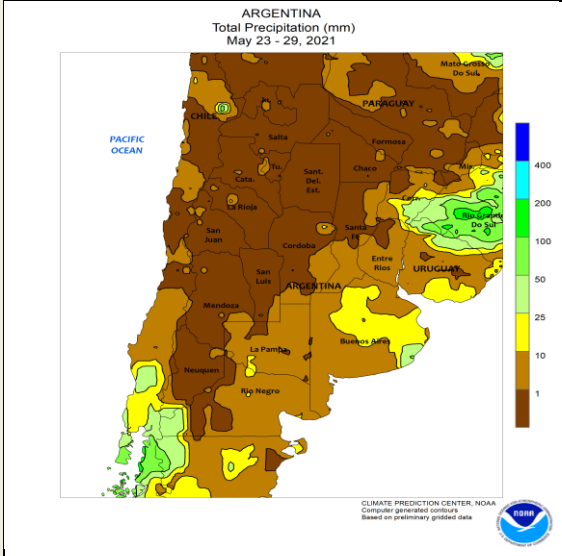

**U.S. DELTA AND SOUTHEAST:** The driest areas from the Carolinas into southern Virginia will see an increase in rain Wednesday into Friday with the driest areas in Georgia seeing rain Thursday into Friday and most areas from Georgia to southern Virginia will receive enough rain to at least temporarily improve soil moisture and conditions for crops. Areas from the Delta through Alabama will see a good mix of rain and sunshine during the next two weeks and planting should advance around the rain.

# South America - Weather

**BRAZIL:** Second season corn areas from Paraguay to Parana will benefit from rain Saturday into Wednesday of next week with additional rain in much of the same region as well as in Sao Paulo June 9-10.  
 o Second season corn will benefit from the moisture while some improvements in long-term drought conditions occur as well.  
 o Central and northern Mato Grosso do Sul into Mato Grosso and Goias will miss much of the rain and stress to corn should steadily rise.  
 \* June 11-15 will be drier, although showers may occur from eastern Mato Grosso and Parana to Minas Gerais.  
**ARGENTINA:** Argentina will see dry weather most often during the next two weeks and good harvest progress should be made with a temporary period of wet weather expected Thursday into Saturday in some northern and central areas.

# Europe, New Zealand and Australia - Weather

**EUROPE:** A period of drying will impact northwestern and west-central Europe and expand into Germany and northwestern Poland into southern Scandinavia through Tuesday. Areas from the U.K. and France through Germany, southern Scandinavia and northwestern Poland will remain plenty moist and fieldwork conditions should improve during the dry spell.

**AUSTRALIA:** Rain will increase Wednesday into Thursday across Australia's eastern production areas. A few showers may occur in western production areas of eastern Australia today and linger over eastern areas Friday. The moisture will be welcome and help replenish soil moisture in central to northeastern New South Wales and surrounding areas of southeastern Queensland. However, pockets of drying will continue to impact western Victoria, southeastern South Australia and southwestern New South Wales. Restricted precipitation and net drying will follow the recent rain in Western Australia for the coming week to ten days. The recent rainfall helped bolster topsoil moisture and will help support winter crops this week, but follow up rainfall will need to return during the second week of June.
