# South Africa - Weather

Western Cape will see a good mix of rain and sunshine this week. Soil moisture will remain at adequate levels in most winter wheat areas and the outlook will remain favorable. Free State and Northern Cape's winter wheat areas will otherwise remain mostly dry this week. Irrigated crop conditions will remain favorable while dryland wheat prospects remain poor. • Western Cape, western and southern Northern Cape, and Eastern Cape will see a mix of rain and sunshine this week. • Much of the rain will occur today through Thursday as a frontal boundary tracks over the region. • Western Cape and southern Eastern Cape will receive 0.50-2.00" of rain with many areas near and along the coast receiving more than 3.00" of rain by next Monday morning. • Other areas will receive 0.25-1.00" of rain and locally greater amounts. • The remaining portions of South Africa will be mostly dry this week. • Any rain that does occur will be lost to evaporation. • Drier than normal weather is slated for most locations July 27 – August 2. • However, light rain will be possible in southern and eastern South Africa.

# United States of America - Weather

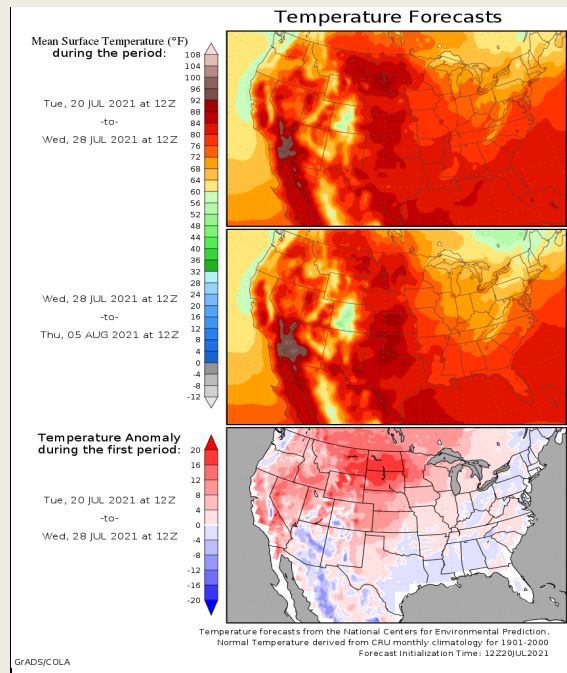

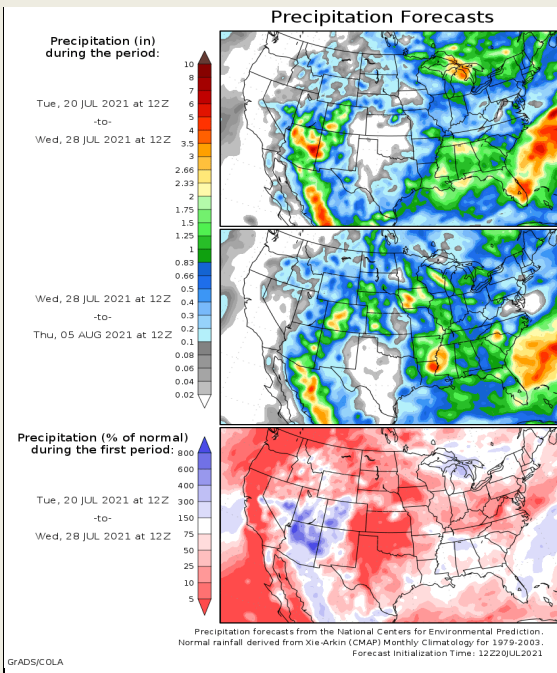

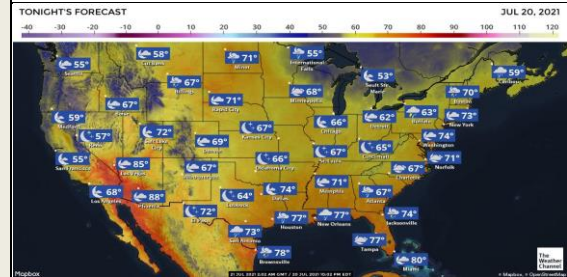

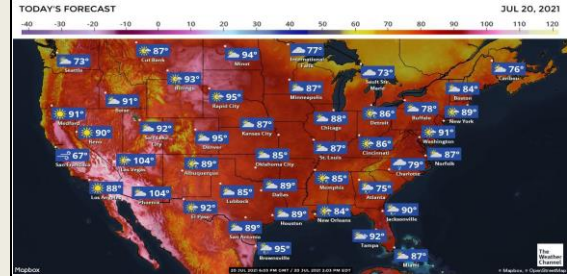

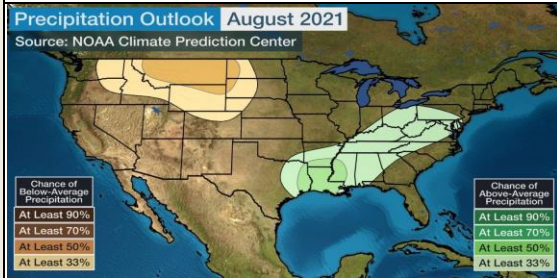

**U.S. MIDWEST:** Rain during the next two weeks will be infrequent and light enough that most areas will be significantly drier by the first days of August than today, especially in the west where temperatures will become warmer than normal later this week.

o Outside of the drier areas in the northwest, most areas have enough subsoil moisture to keep crop conditions favorable through the next two weeks with temperatures not likely hot enough during the next week to cause serious crop stress.

o Starting Friday, there will be regular rounds of showers and thunderstorms in the northern and eastern Midwest that should not bring soaking rain to many areas, but the moisture will aid corn pollination and will slow drying rates.

**U.S. DELTA AND SOUTHEAST:** The Delta and the Southeast will see two more weeks of mostly favorable crop conditions. Temperatures will be mostly seasonable and the lack of excessive heat expected will help to conserve soil moisture.

Shower activity starting Wednesday will be erratic enough that some areas will dry down significantly and will need an increase in rain in August to ensure favorable conditions for crops continue while soil moisture should be great enough to support crop development into early August.

# South America - Weather

**BRAZIL:** Outside of some showers in northeastern Brazil much of Brazil and Paraguay will be dry through Sunday and fieldwork should advance well.  
 o Showers will return to portions of far southern Brazil Sunday into next Tuesday with showers expanding from Paraguay into southern and parts of central Brazil later next week. Most of the rain outside of the far south will be light and should not have much of an impact on long term drought conditions, but the moisture will be welcome.

**ARGENTINA:** Outside of an increase in rain Sunday into Tuesday of next week, most days during the next two weeks will be dry and fieldwork should advance well while most winter wheat in the west will remain in need of rain.  
 o Rain Sunday into Tuesday, July 27 will be greatest in the south and east and parts of Cordoba will see rain, but amounts there will be less than 0.25" most often and improvements in wheat conditions should be limited.  
 o Eastern Buenos Aires to Entre Rios will be wettest and will receive 0.20-1.0" and locally more.

# Europe, New Zealand and Australia - Weather

**EUROPE:** The most important weather in Europe over the next ten days will be the arrival of some much needed rain in the western Balkan Countries where it has been dry and very warm to hot the past couple of weeks. The moisture expected will bring needed change to the region's crops by replenishing topsoil moisture and reducing crop stress. Other areas in the continent will continue plenty wet especially from the heart of France to Poland, Slovakia and western Ukraine. Net drying is expected in far western France, the U.K., Scandinavia and from Portugal and Spain to southern Italy and Greece.

**AUSTRALIA:** Rounds of rain will continue to impact Western Australia as well as southeastern portions of Australia during the coming ten days to two weeks providing a mostly favorable environment for winter wheat, barley and canola establishment. Rain will be greatest in Western Australia today into Tuesday and additional rainfall is expected to return early next week in Western Australia.

Moisture totals by this time next week will range from 0.30 to 1.00 inch and local totals in excess of 1.00 inch.
