South Africa - Weather

Western Cape will see a good mix of rain and sunshine during the coming week. Although many areas will not receive enough rain to significantly improve the moisture profile, the rain will still be welcome for the winter wheat. Aggressive development will continue in much of the region. Free State and Northern Cape will remain mostly dry during the coming week. Irrigated winter wheat conditions will be good despite the lack of rain. Dryland crops in Free State will otherwise continue to develop unevenly or poorly. • Western Cape and portions of Eastern Cape and southern Northern Cape will see a mix of rain and sunshine during the coming week ☒ The first round of rain will occur Thursday with more showers expected later this weekend and early next week ☒ Portions of Western Cape and Eastern Cape will receive 0.40-1.50" of rain with locally greater amounts by next Tuesday morning
☒ Much of the rain that occurs in southern Northern Cape will be lost to evaporation
• The remaining portions of South Africa will remain mostly dry during the coming week
• No rain that does occur will be lost to evaporation • Alternating periods of rain and sunshine are slated for portions of South Africa July 14 – 20

United States of America - Weather

U.S. MIDWEST: • Two more weeks of favorable conditions for crops will occur in much of the Midwest as regular rounds of rain and a lack of excessive heat are expected while the driest areas in the northwest should see some improvements in yield potentials as crops there will benefit from cooler temperatures and a few rounds of rain.
o Permanent losses have already occurred in some of the drier areas in the northwest and a full restoration of yield potentials is not possible, but the better weather conditions expected during the next two weeks should allow for a boost in yields in many areas.

U.S. DELTA AND SOUTHEAST: The two-week outlook for the Delta and the Southeast has not changed much since late last week and periods of rain and sunshine will continue with many areas likely to dry down overall. Favorable soil moisture in place today and occasional rounds of rain in most areas should keep conditions for crop development favorable in most areas. Tropical Storm Elsa is expected to make landfall Wednesday on the northwestern Florida Panhandle as a strong tropical storm or weak hurricane with maximum sustained winds near 70 mph.

South America - Weather

BRAZIL: Dry weather will be most common through the next two weeks in Brazil and Paraguay and fieldwork should advance well.
 o A few light showers will occur on occasion in coastal areas of the south while occasional rounds of showers occur from eastern Bahia to Espirito Santo.

ARGENTINA: • Dry weather is still expected to be most common through the next two weeks and good harvest progress should continue with an increase in showers starting Tuesday and continuing into Sunday July 11.
 o Some of the driest areas in western Argentina will receive at least some rain, but much of the rain will be light and wheat in Cordoba will likely be left in need of much more rain to induce meaningful increases in soil moisture.
 ☒ Rain will increase Tuesday into Wednesday from northeastern La Pampa into Buenos Aires where most areas will receive up to 0.50" of rain and locally more with a band of greater rain from a part of northwestern to south-central Buenos Aires.

Europe, New Zealand and Australia - Weather

EUROPE: Not much has changed in the overall outlook from late last week and rounds of precipitation will maintain moist to wet conditions over much of the U.K. and France through northern Italy, Germany and Scandinavia into Poland, Slovakia, Hungary and Romania during the coming ten days to two weeks. Showers will be scattered in the Balkan Nations, but any moisture will be welcome and beneficial this week.

AUSTRALIA: Improvements will occur in Western Australia this week and some scattered showers will occur in New South Wales Thursday and Friday. With that said, much greater rainfall will still be needed from interior South Australia and northwestern Victoria through western New South Wales into southern Queensland to bolster soil moisture conditions and provide a better environment for crops.
