South Africa - Weather

A frontal boundary will bring varying amounts of rain to portions of South Africa later this week and weekend. Precipitation in Western Cape will help keep soil moisture rated adequately. Winter wheat prospects across the region will remain favorable. Free State and Northern Cape will have a few opportunities for mostly light rain as well. Irrigated wheat in these areas will remain favorable while dryland wheat in Free State will still need additional rain to improve the outlook. • South Africa will see variable rainfall this week o Light rain will often be scattered across Natal, Mpumalanga, Free State, and neighboring areas through Wednesday o A frontal boundary will then bring rain to Western Cape and portions of western and southern Northern Cape, Eastern Cape, Natal, and portions of Free State and Mpumalanga Thursday into Saturday o The eastern half of Eastern Cape into southern Natal will receive 1.00-4.00" of rain and locally greater amounts by next Monday morning o Other areas will receive 0.40-2.00" of rain with locally greater amounts in southwestern Western Cape o The remaining portions of South Africa will be mostly dry this week o Any precipitation that occurs will be lost to evaporation or too light to impact long-term soil conditions

United States of America - Weather

U.S. MIDWEST: Today's forecast is wetter overall than advertised late last week and the driest areas in the west will see additional relief from dryness while enough rain falls elsewhere to maintain mostly favorable conditions for crop development.

- o Soybeans in the drought areas of the northwest that have not been too severely damaged should respond well to the rain and at least some improvements in yields should result with the rain likely too late to have much of an impact on corn yields.

U.S. DELTA AND SOUTHEAST: Daily rounds of showers and thunderstorms will occur through the next two weeks in the Southeast and although some areas will dry down, favorable soil moisture in place today along with the rain should keep conditions for most crops favorable.

- o The Delta will receive much less rain than the Southeast and will also see warmer temperatures and significant drying is expected in much of the region.
- o Most of the Delta has enough soil moisture to prevent serious crop stress from evolving during the next two weeks, but there may be pockets of increasing stress, especially in the south where soil moisture is short.

South America - Weather

BRAZIL: Today's forecast is wetter than what was advertised late last week and areas from Paraguay into central and southern Brazil will see multiple rounds of rain and some improvements in long-term drought conditions will result, but an extended period of wet weather will be needed to end the drought.

- o Interruptions to fieldwork will occur, but some fieldwork should advance around the rain.
- o Mato Grosso into Goias will miss much of the rain and fieldwork should advance well.

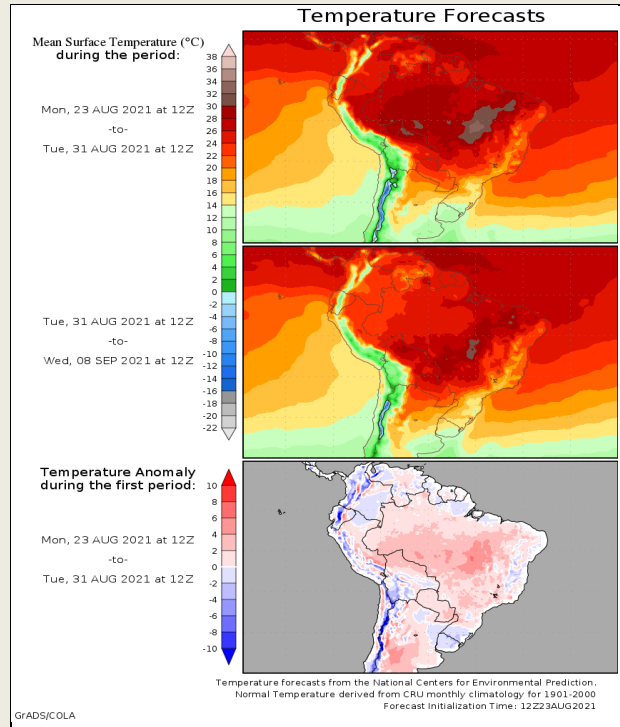

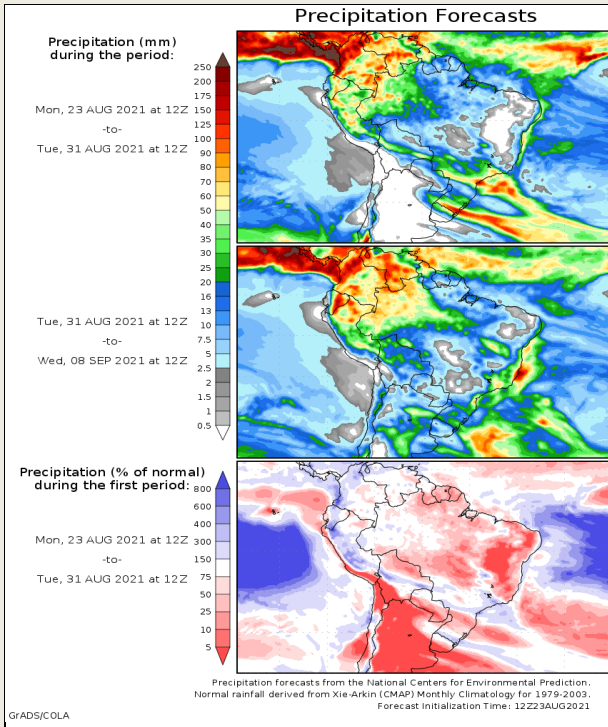

ARGENTINA: Daily rounds of showers will occur in Corrientes through Wednesday while the remainder of the country is mostly dry with mostly dry conditions Thursday through this weekend before a few showers occur in the south next week.

- o Winter wheat in the west will remain in need of rain to increase soil moisture before the crop comes out of its semi-dormant state.

Europe, New Zealand and Australia - Weather

EUROPE: Timely rainfall will occur from portions of Germany and northeastern Italy into Poland and Scandinavia early this week.

o However, pockets of drying will continue in Germany, into parts of Poland and the Czech Republic around the rainfall and harvest progress will continue in these drier areas. Elsewhere the rain will help ease drying of topsoil moisture recently, although disruption to fieldwork and harvest will occur.

AUSTRALIA: Rain will increase in eastern New South Wales today into Tuesday. Scattered rain totals will occur into southeastern Queensland, but will be brief most often and greater moisture will be needed to end long term drought. Northern New South Wales into Queensland will continue to receive restricted precipitation during the next ten days where dryness is present and greater rainfall will be needed to support growth when crops eventually come out of dormancy.
