

Weather Report

22 October 2021

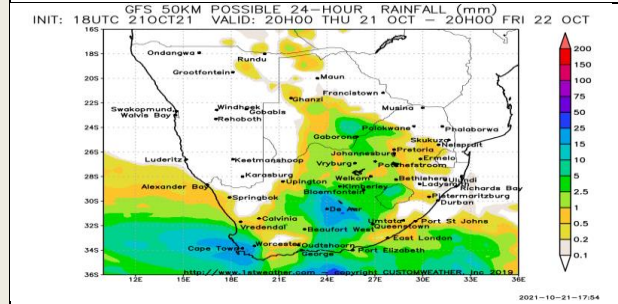

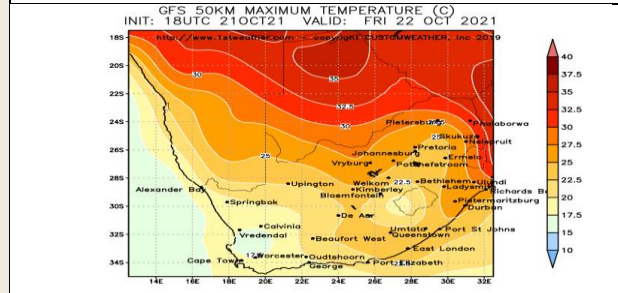

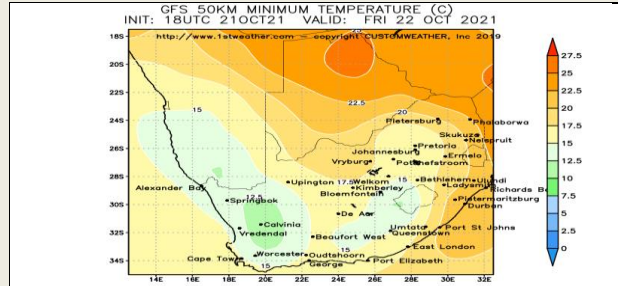

South Africa - Weather

South Africa will see a mix of erratic rain and sunshine during the coming week. Winter wheat harvesting may be sluggish at times and minor quality reductions will be possible in the wettest locations. However, no significant production losses will occur. The moisture profile will otherwise slowly increase in much of the summer crop production region outside Limpopo. Planting and establishment conditions will either improve or remain favorable. • South Africa will see a mix of erratic rain and sunshine during the coming week. A disturbance will initially generate scattered showers and thunderstorms for western and central South Africa today and Friday morning. A frontal boundary will promote mostly light rain for portions of western and southern South Africa Friday into Saturday. Scattered showers and isolated thunderstorms will then evolve on a frequent basis later this weekend into the middle of next week for most locations. Moisture totals by next Thursday morning will range from 0.75-3.00" with local amounts of 4.00" or slightly more from Natal into Free State and North West. Limpopo and portions of Eastern Cape will also only receive 0.10-0.50" of moisture. Eastern and southern South Africa will see a mix of rain and sunshine October 29 – November 4. Western South Africa will be drier biased.

United States of America - Weather

U.S. MIDWEST: The Midwest will see two significant rain events from Saturday through next Thursday temporarily stalling fieldwork in much of the region.
 o Harvesting should still advance in most areas into Saturday with a gradual resumption of fieldwork expected in the last days of October and early November.

U.S. DELTA AND SOUTHEAST: The Delta and the Southeast will see more sunshine than rain during the next two weeks with a notable exception Sunday night into next Thursday when two rounds of rain interrupt fieldwork in much of the region.
 o The rain expected should cause some temporary cotton discoloration while winter crops benefit from increases in soil moisture expected.

South America - Weather

BRAZIL: Southern Paraguay and southern Brazil will be dry most often through the next two weeks and that will be beneficial for fieldwork while abundant soil moisture in place today and two rounds of timely rain will keep crop conditions mostly favorable. Regular rounds of showers and thunderstorms will occur through the next two weeks across northern and central Brazil inducing some increases in soil moisture while maintaining or improving conditions for planting and establishment of crops.

ARGENTINA: Argentina will see more sunshine than rain and good planting progress through the next two weeks, but important rain events today into Saturday and Oct. 29-31 should keep soil conditions favorable for planting and establishment of crops in most areas. Northwestern and some southwestern areas will be an exception as these already have short soil moisture and rain this week should not be great enough to do more than briefly moisten the soil. Warmer temperatures and faster drying rates will occur next week raising the importance of each round of rain.

o Additional rain will be needed again soon to keep the soil from drying out.

Europe, New Zealand and Australia - Weather

EUROPE: Rounds of rain will be greatest from the U.K. and North Sea Region through northern Germany, Scandinavia into the Baltic Sea Region and northern Russia this week.

o Moisture totals will vary from 0.40 to 1.20 inches and local totals in excess of 1.50 inches by this time next week and moist conditions will remain throughout northern areas. • Pockets of showers and thunderstorms will occur from eastern France and Germany into the Balkan Nations Wednesday into Saturday. Most of the moisture will be brief and erratic and light moisture totals will occur most often.

AUSTRALIA: good mix of precipitation and sunshine will occur over southern Australia as well as the central to southeastern coastal areas of Queensland and northeastern New South Wales this week. The environment will be ideal for reproducing and filling winter crops and some eastern production areas of Queensland sorghum and cotton areas will benefit from the moisture.

o Areas throughout interior New South Wales will maintain good yield potential, but greater rain would be welcome over interior Queensland to provide a better environment for dryland cotton and sorghum planting
