

Weather Report

11 March 2022

South Africa - Weather

South Africa's production areas will continue to see several waves of rain during the coming week. The precipitation will maintain a good environment for late-season development and reproduction. However, maturation and early season harvesting may be sluggish in the wettest locations. No significant quality declines are expected yet, though the country needs to see drier weather later this month and early April as more crops start maturing. Scattered showers and thunderstorms will evolve on a frequent basis for South Africa with some of the most significant rain occurring this weekend into Tuesday as a strong frontal boundary slowly advances over the country

- Moisture totals by next Thursday morning will range from 0.75-3.00" in most locations with locally greater amounts in Eastern Cape, southern Natal, and neighboring areas
- Drier pockets are also expected in Limpopo and neighboring areas
- Eastern and central South Africa will see a mix of light rain and sunshine March 18 – 24
- Western South Africa will receive little to no rain

United States of America - Weather

U.S. MIDWEST: The Midwest will see dry weather most often through the next two weeks and conditions for fieldwork will improve overall around two rounds of organized precipitation with west-central and southwestern areas left in need of greater precipitation to improve soil moisture before the planting season. Much colder normal temperatures will be common through Saturday before warming occurs and most areas are warmer than normal Sunday through next week with Tuesday through next Thursday much warmer than normal.

U.S. DELTA AND SOUTHEAST: The Delta and the Southeast will see two more rounds of precipitation and little fieldwork through Saturday with enough rain in the drier areas in and near southern Georgia to induce improvements in soil moisture.

o The northern Delta will see the least precipitation and may see a quick increase in fieldwork when the Delta and the Southeast become mostly dry Sunday through Mar. 16.

South America - Weather

BRAZIL: Regular rounds of showers and thunderstorms will induce additional improvements in conditions for summer crops and for Safrinha crop planting and development Sunday through the following Sunday in the driest areas from Paraguay and Mato Grosso do Sul to southern Brazil. o Warm to hot temperatures will occur at times and that will reduce increases in soil moisture that would occur if temperatures were cooler. Most of the remainder of Brazil will receive enough rain during the next two weeks to support crop development and slow fieldwork with some exceptions in northeastern Brazil.

ARGENTINA: Additional rain will fall on portions of northern Argentina today and further improvements in crop and soil conditions will result before a drier weather pattern occurs Friday through Mar. 25 allowing for fieldwork to advance well across the country. o Most areas will have enough soil moisture in place to support crop development through the next two weeks, but some west-central and southern areas will need an increase in rain late this month prevent crops from becoming stressed by a lack of soil moisture.

Europe, New Zealand and Australia - Weather

EUROPE: Significant rain in Spain, Portugal, and southern France through the next ten days will be beneficial and should provide a notable increase in topsoil moisture which will lead to favorable spring planting and early season crop development. Below average precipitation in the northeastern part of the region is not a concern as of right now, especially since soil moisture is favorable; however, greater moisture will be needed later in the month as more warming occurs.

AUSTRALIA: Crop conditions in eastern Australia are still rated mostly well, but there is need for moisture in the unirrigated late-season sorghum and immature dryland cotton production areas. Dryness has not festered into a huge problem, but there is some moisture stress and rain would help to mitigate that issue. Irrigated crops are performing well and no change is expected.

Early season grain and oilseed maturation and harvest progress is advancing well, but there is need for greater rainfall for immature crops. The showers advertised in this coming week will help to provide a little moisture, but evaporation will leave a need for more.
