

Weather Report

22 April 2022

South Africa - Weather

The main crop areas in South Africa will continue to see a mix of rain and sunshine during the coming week. The rain will slow harvesting at times, though producers will still have several opportunities to get into the fields. No quality impacts are expected in areas that receive the greatest amount of rain.

- Eastern and central South Africa will see a mix of rain and sunshine during the coming week
- o Much of the rain will evolve Friday and this weekend as a frontal boundary advances over the country
- o Light rain will also evolve in a few locations at the beginning and middle of next week
- o Moisture totals by next Thursday morning will range from 0.40-2.00" with local amounts over 3.00" in Eastern Cape
- o Many areas in North West and western Free State will also only receive 0.10-0.40" of rain
- Western South Africa will generally be drier biased during the coming week
- o A few locations in Northern Cape will still receive 0.25-1.00" of rain by next Thursday morning
- o Any rain that evolves elsewhere will generally be lost to evaporation
- Alternating periods of light rain and sunshine are slated for much of South Africa April 29 – May 5

United States of America - Weather

U.S. MIDWEST: Frequent precipitation through Tuesday along with temperatures that will often be cool will keep fieldwork to a minimum in most areas. The moisture will be beneficial in the driest areas from eastern Nebraska into western Iowa, but the region will need additional precipitation to induce a full restoration of soil moisture. Fieldwork should advance well from southeastern South Dakota to east-central Nebraska and northwestern Iowa where the soil is dry enough to allow for farming activity and rain there will be light.

U.S. DELTA AND SOUTHEAST: Dry weather will be most common through the next two weeks in the Delta and the Southeast and planting should steadily increase and become aggressive around one round of nearly widespread rain occurring Sunday evening into Tuesday.
o Much of the Delta and especially the Southeast will have dried down significantly by the first days in May and greater rain will be needed soon to restore the topsoil moisture for newly planted crops.

South America - Weather

BRAZIL: Mato Grosso and Goias will see little rain during the next two weeks and stress to the Safinha corn crop may increase in May once the soil moisture in place has been lost to evaporation. Subsoil moisture is still adequate to support the needs of most of the corn into at least early May, but after that stress to the crop should rise and yields should decline unless rain returns. Rain in the region is typically minimal in May and it would take an unseasonable rain event to induce notable improvements in soil moisture and crop conditions. Most of the remainder of central and northern Brazil will also see a restricted rainfall pattern through the next two weeks and fieldwork should advance well while Paraguay and far southern Brazil see regular rounds of showers and thunderstorms Thursday through May 3.

ARGENTINA: Much of Argentina will see two rounds of rain through next Tuesday that will help to keep soil conditions favorable in most areas while causing some interruptions to fieldwork with rain great enough in some cotton areas of the north to raise concerns over quality declines.

Europe, New Zealand and Australia - Weather

EUROPE: A mostly favorable weather pattern is expected through the first week of the outlook. There will be areas of rain with some pockets of heavy rain; however, the rain will be erratically distributed enough to not have a significant impact on fieldwork advancement. Above average temperatures this week will help warm the soil. There will be some pockets that receive no meaningful moisture and will be need of more rain in the second week.

AUSTRALIA: Rain in the first week of the outlook will mainly occur in South Australia which will be beneficial due to very short soil moisture. Some showers will also occur in Victoria and Western Australia; though, not enough rain is expected for much of a rise in soil moisture in these two states. Dryness in cotton and sorghum production areas of the east will be beneficial for harvesting progress.
