

Weather Report

06 May 2022

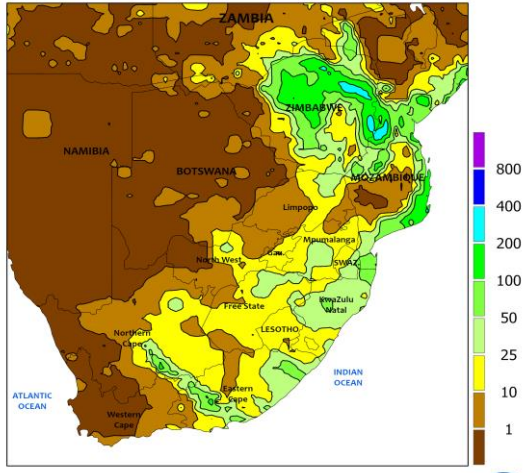

South Africa - Weather

The main crop areas in South Africa will remain drier biased during the coming week. Harvesting and general fieldwork will advance swiftly, even in areas that see periods of light rain. Winter wheat areas in Western Cape, Free State, and neighboring locations will otherwise need to see timely rain later this month into June to support ideal planting and establishment. • A large portion of South Africa will be drier biased during the coming week

- o Eastern Cape, Natal, Western Cape, and neighboring areas will still see periods of rain
- o Portions of Eastern Cape will receive 0.50-2.00" of rain by next Thursday morning
- o However, most locations will not receive enough rain to counter evaporation
- Much of South Africa will remain drier biased May 13 – 19
- o Most areas will still have an opportunity for light rain

United States of America - Weather

U.S. MIDWEST: The eastern Corn Belt will see little rain along with warmer temperatures and faster drying rates Saturday through Friday of next week and planting should quickly increase once the ground firms up after rain comes to an end Friday.

- o Isolated to scattered showers will occur next week with planting likely to advance around the showers before rain increases May 14-16. The eastern Dakotas into Minnesota and Wisconsin will be mostly dry into Saturday and planting should increase in the drier areas, but improvements will be gradual as air and soil temperatures and evaporation rates will be low.

U.S. DELTA AND SOUTHEAST: The Delta and the Southeast will see more sunshine than rain and good planting progress through the next two weeks while soil moisture should be adequate to support the needs of most crops.

- o Northern Florida into southern Georgia may an exception and will need to be monitored for increasing dryness as the region has lost most of its topsoil moisture and will often be disfavored for rain during the next two week.

South America - Weather

BRAZIL: Mato Grosso and Goias will see little rain during the next two weeks and stress to the Safinha corn crop will increase as the remaining soil moisture is lost to evaporation with declines in yields likely to result. The remainder of Brazil will also see a restricted rainfall pattern through most of the next two weeks and fieldwork should advance well.

ARGENTINA: Argentina will be dry through most of the next two weeks and fieldwork should advance well while most areas should have enough soil moisture to support the needs of crops.

o Exceptions will occur from San Luis to western and northern Cordoba and southern Santiago del Estero where subsoil moisture is short and immature crops should see rising levels of stress until rain returns.

Europe, New Zealand and Australia - Weather

EUROPE: Dryness is not much of an issue as of right now; however, it could start to become more of an issue gradually in the next two weeks due to below average rainfall and above average temperatures in a large portion of the region. Timely rain will be needed this month and is unlikely through at least the next ten days to two weeks. There will be some rain mainly in central and some southern areas in the first seven days of the outlook; however, warming temperatures will raise evaporation rates and the areas that miss out from meaningful rain will start to dry out more quickly.

AUSTRALIA: Significant rainfall in production areas of Queensland and northern New South Wales Sunday through Wednesday will be beneficial for winter crops due to the rise in topsoil moisture that this will cause but will cause delays for harvesting of summer crops. Rain next week will also increase in Western Australia which will be beneficial for emergence and establishment conditions.
