# South Africa - Weather

South Africa will remain mostly dry through the end of next week. Harvesting of the summer crops will advance swiftly. Winter wheat planting and establishment conditions will be mostly good in western and central South Africa, though a good shot of rain will be needed later this month into early July to maintain a good outlook for the crops. South Africa will be dry or mostly dry through the end of next week

o Pockets near the southern and eastern coastline will have a few opportunities for light rain, though resulting rainfall will be lost to evaporation

• Drier than normal conditions will persist for a large section of South Africa June 11 – 17

o However, Western Cape and neighboring areas could see periods of rain

## United States of America - Weather

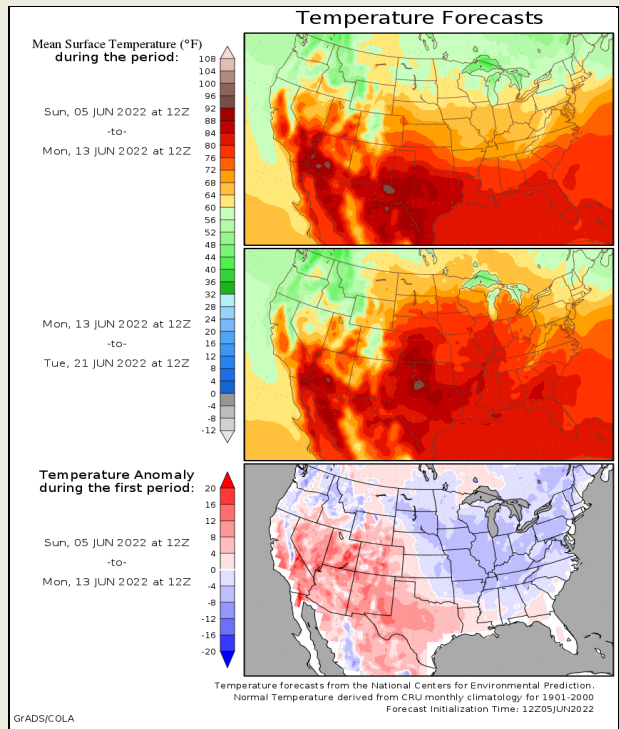

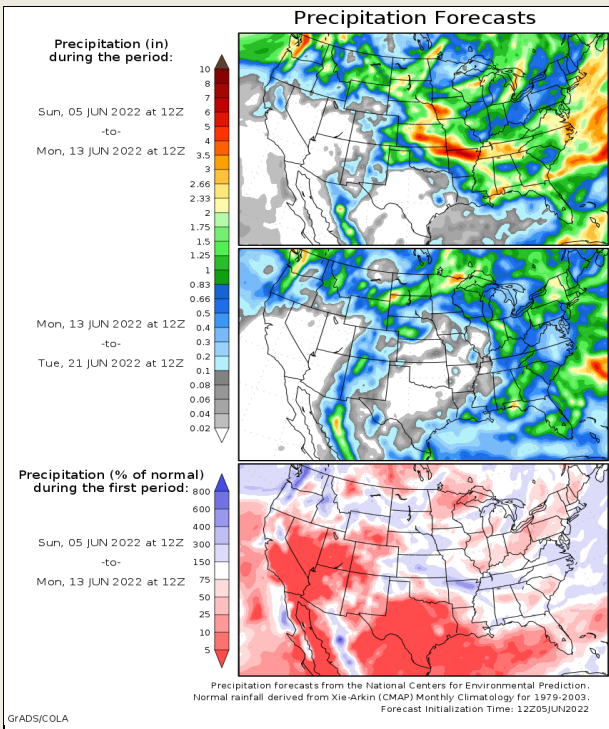

**U.S. MIDWEST:** Regular rounds of showers and thunderstorms through the next two weeks and at least another week of mild temperatures will maintain favorable conditions for developing crops with rain not likely to fall frequently enough to prevent late planting from taking place between rounds of precipitation.

o The far northwestern Corn Belt will have good opportunities for planting as little to no rain of significance is expected through at the next week.

**U.S. DELTA AND SOUTHEAST:** Today's forecast is a little wetter overall through the next ten days in the Delta and the Southeast, but more sunshine than rain is still expected and many areas will dry down overall allowing for good planting progress while raising the need for greater rain in the second half of the month.

o All areas will receive at least some rain that will prevent most locations from becoming excessively dry during the next two weeks with greater rain needed soon across the region and especially from Georgia to southeastern North Carolina.

☑ Beneficial rain is expected today in the driest areas from South Carolina to eastern North Carolina.

# South America - Weather

**BRAZIL:** Western into southern Mato Grosso and southernmost Goias will see scattered showers Wednesday through next Friday with a few more light showers June 11-17 and some Safrinha corn should benefit from the moisture while most of the rain will be too light and come too late to have a significant impact on yield potentials. o Much of central to eastern Mato Grosso into central and northern Goias will miss next week's rain. • Additional rain will fall through Saturday through Tuesday from Paraguay into southern Brazil and fieldwork will be sluggish before drier weather returns Wednesday through June 17.

**ARGENTINA:** Dry weather will be most common through the next two weeks and fieldwork will advance well around light showers that infrequently develop in small parts of the country. o Greater rain is needed in the drier areas of western Argentina to improve conditions for winter crops. o An exception will occur Saturday into Monday when Chaco to Corrientes receives 0.75-2.0" of rain and locally more with lighter rain in nearby areas.

# Europe, New Zealand and Australia - Weather

**EUROPE:** Enough rain is still expected in the first week of the outlook for at least some rise in topsoil moisture in most areas except Portugal, Spain, and southeastern France. Some needed rain is likely in Italy after Monday. The need for greater rainfall continues to rise in southeastern France. There is also a need for more rain in Spain and Portugal; though, this part of the region does not typically get much rain this time of year.

**AUSTRALIA:** Conditions are still expected to be favorable for winter crop production through at least the first week of the outlook. Enough rain will occur in most areas to maintain a favorable amount of soil moisture. Western Australia will be the driest part of the region which will not be an issue this week; however, the need for rain will increase later in June.
