# South Africa - Weather

Western and central South Africa will see a mix of erratic rain and sunshine through the end of next week. Although the rain will be too light to significantly increase soil moisture, the precipitation will still help maintain a good outlook for the winter wheat in much of Western Cape, Northern Cape, Free State, and neighboring areas. Eastern South Africa will have a few opportunities for light rain as well. • Western and central South Africa will see a mix of rain and sunshine through the end of next week • A frontal boundary will bring light rain to a few locations today and Saturday • The most widespread rain will evolve Monday and Tuesday as a disturbance advances over the region • Portions of Northern Cape, Free State, North West, and western sections of Western Cape will receive 0.25-1.50" of rain by next Friday morning • Most other locations will not receive enough rain to counter evaporation • Eastern South Africa will be drier than normal through the end of next week • Brief periods of light rain will occur, though resulting rainfall will be lost to evaporation • South Africa will generally be drier biased August 6 – 12 • Periods of light rain will still be possible, most notably in southern and western South Africa

# United States of America - Weather

**U.S. MIDWEST:** Mild temperatures through this weekend in much of the Midwest will keep conditions for crops and soil moisture mostly favorable with exceptions detailed below. Southeastern South Dakota and southwestern Minnesota to east-central Nebraska and much of western into central Iowa have missed out on significant rain recently while the soil is mostly short of moisture. Crop conditions through this weekend will not deteriorate as quickly as they would if temperatures were hot, but the soil is dry enough that crop stress and declines in yield potentials should increase.

**U.S. DELTA AND SOUTHEAST:** The northern Delta through northern Alabama will benefit from moderate to locally heavy rain through Sunday and at least temporary improvements in conditions for crops will result while most other areas benefit from lighter rain. A drier-biased weather pattern will resume Monday through Aug. 11, but there will be showers most days that should keep the soil from becoming excessively dry in most of the Southeast while the Delta to northern Alabama should see another period of increasing crop stress.

# South America - Weather

**BRAZIL:** Dry weather will be most common through the next two weeks with occasional rounds of rain in southern Paraguay and southern Brazil where temporary interruptions to fieldwork will result while regular rounds of light showers occur in eastern Bahia.

- o Rain will be greatest in the south Thursday into Friday and Tuesday into Thursday of next week with rain extending as far north as parts of Sao Paulo where most of the precipitation will be light.

**ARGENTINA:** Dry weather and favorable conditions for fieldwork will occur through much of the next two weeks with a couple rounds of showers and thunderstorms that will favor eastern areas with some beneficial, but light, rain in western Argentina into Thursday.

- o Winter wheat in western Argentina will see some benefit from the rain, but improvements in crop conditions will likely be temporary without follow-up rain.
- o Rain into Thursday will be greatest from southern Santa Fe and northern Buenos Aires where totals will be 0.15-0.85" and locally more.
- Light rain will fall on many other areas with few locations from Cordoba to Santiago del Estero seeing more than 0.25" of rain.

# Europe, New Zealand and Australia - Weather

**EUROPE:** Temperatures this week will still be above average in most of the region; though, not quite as extreme as the previous week, particularly in northern Europe. Today will be hot again in the north, but then some needed cooling will occur. Erratic shower and thunderstorm activity will occur in both northern and southern Europe; though, it will be difficult for this to counter evaporation outside of a few localized areas.

**AUSTRALIA:** Wheat, barley and canola are expected to be well established prior to spring this year. Soil moisture has recently increased from Queensland into eastern New South Wales benefiting wheat, barley and canola areas that had been a little dry previously. Now, the only drier biased areas in the nation area in minor crop areas of South Australia where some showers may evolve briefly in the coming week.
