# South Africa - Weather

Limited rainfall is slated for much of South Africa through the end of next week. Winter wheat prospects remain favorable in Western Cape, Northern Cape, and Free State; though a good soaking of rain would still be welcome later this month for the later planted crops. Maturation conditions will otherwise be favorable. South Africa will be drier biased through the end of next week. A frontal boundary will still promote light rain in portions of southern and eastern South Africa this weekend and early next week.

- o However, resulting rainfall will be lost to evaporation
- o Drier than normal weather will persist for much of South Africa September 17 – 23
- o Periods of light rain will still be possible in the south

# United States of America - Weather

**U.S. MIDWEST:** Mostly favorable conditions for crop maturation and early harvesting will occur during the next ten days to two weeks as temperatures will be warmer than normal most often and rain will be infrequent. A couple rounds of organized rain will occur and some of the driest areas from eastern Nebraska and southeastern South Dakota into southwestern Minnesota and Iowa will benefit from rain Thursday night into this weekend, although the moisture will come too late for this season's crops. Most areas are dry enough that the rain expected should cause little more than temporary interruptions to fieldwork and the several days of dry weather the Ohio River Basin will see in advance of rain this weekend will be important in preventing some areas from becoming excessively wet.

**U.S. DELTA AND SOUTHEAST:** Outside of a widespread rain event Friday into Monday, the Delta and the Southeast will see infrequent enough rain during the next two weeks that fieldwork and crop maturation and harvesting should occur mostly favorable once the region dries out after that rain event. Northern Florida to Georgia and South Carolina will be wettest and parts of the region will receive heavy rain.

## South America - Weather

**BRAZIL:** Regular rounds of showers and thunderstorms will occur during the next two weeks from central and southern Paraguay and southern Brazil where the rain will induce favorable increases in soil moisture for summer crop planting while causing some interruptions to fieldwork. Eastern Bahia also see regular rounds of showers and thunderstorms while little rain falls elsewhere through early next before of Mato Grosso will see showers Wednesday through Sep. 23. Much of the rain will be too light to induce significant increases in soil moisture in the warm to hot temperatures expected, but a few locally strong storms should occur and a few areas may see temporary increases in soil moisture.

**ARGENTINA:** A restricted rainfall pattern will be in place through the next two weeks leaving many areas, especially in the west, in need of rain to improve soil moisture for the summer crop planting season.

o Isolated to scattered and mostly light showers will occur in eastern Argentina Thursday with pats of central and eastern Argentina seeing showers Sep. 15-16.

## Europe, New Zealand and Australia - Weather

**EUROPE:** Improvement in topsoil moisture is still expected in a majority of the region over the next seven days as a result of rain. Rainfall in the region will get an enhancement next week as well due to remnants of what used to be Hurricane Danielle that will move into the region, including into areas such as Spain and Portugal. The increase in topsoil moisture in this area could be significant. Minor fieldwork delays are expected as a result of the rain. Additional beneficial rain will occur in the second week of the outlook as well.

**AUSTRALIA:** Enough rain is still expected in the next seven days to satisfy the needs of all crops; however, rain may be a little too much in some eastern areas such as New South Wales and Victoria leading to fieldwork delays, particularly Wednesday into Thursday. The long term outlook for crop development remains good, but warmer temperatures are needed to promote faster crop development and improved drying conditions between rain events. Unusually cool temperatures are still expected in the second week of the outlook.
