South Africa - Weather

Southern and eastern South Africa will receive varying amounts of rain overnight tonight into Tuesday as a frontal boundary slowly advances over the country. Any wheat that is still developing in Western Cape will welcome the moisture. Other wheat areas in Northern Cape and Free State will miss out in the rain, though late-season development conditions will remain favorable as well. Planting of the spring crops normally begins in October and the precipitation that falls in southern and eastern South Africa will improve early-season prospects. Additional rain will be needed to completely fix the moisture deficits. • After a brief period of mostly dry weather today, a frontal boundary will slowly advance over South Africa overnight tonight into Tuesday o Rain ahead of the front will be scattered from Western Cape and Eastern Cape into Natal, Mpumalanga, and neighboring areas during this time o Little to no follow-up rain is expected later next week o Eastern Cape, Natal, and Mpumalanga will receive 0.75-3.00" of rain and locally greater amounts by next Friday morning o Western Cape and Limpopo will receive 0.50-1.50" of rain with locally greater amounts in southern Limpopo o Pockets in southern Northern Cape and Free State will receive 0.10-0.75" of rain while little to no rain falls elsewhere

United States of America - Weather

U.S. MIDWEST: Mostly favorable conditions for crop maturation and early harvesting will continue during the next two weeks as temperatures will be mostly warmer than normal for at least another week and rain will be infrequent. Many areas will receive at least some rain by Sunday, but with warm temperatures and relatively dry soils in most areas interruptions to fieldwork will be brief. Winter crop areas will benefit from the showers expected during the next two weeks. Temperatures will be much warmer than normal to unseasonably warm into the middle of next week before cooling occurs in the northwest where temperatures are not far from normal late next week while much warmer than normal temperatures continue in the south.

U.S. DELTA AND SOUTHEAST: The Delta and the Southeast will see a restricted rainfall pattern and favorable conditions for crop maturation and harvesting through the next two weeks.
o A few showers may occur in the south through Monday with the resulting rain not likely great enough to cause significant interruptions to fieldwork.

South America - Weather

BRAZIL: Today's forecast is drier from eastern Mato Grosso into Goias where little to no rain of significance is expected through Wednesday while central and western Mato Grosso will receive rain Sunday into Wednesday with rain in Mato Grosso do Sul and Sao Paulo as well. Rain Sunday into Wednesday will likely induce at least temporary increases in soil moisture in parts of the region and some planting may result from the rain with follow-up rain needed to keep soil moisture supportive of crop germination and establishment.

Additional showers will occur Thursday into Sep. 24 with better organized rain possible Sep. 25-27 and confidence for this event low.

ARGENTINA: A restricted rainfall pattern will be in place through most of the next two weeks leaving many areas, especially in the west, in need of rain to improve soil moisture for the summer crop planting season with one round of welcome, but often light, rain in southern, central, and eastern areas Saturday into Tuesday.

Fieldwork should advance well in much of the country and some additional sunseed planting should occur after the coming rain.

Europe, New Zealand and Australia - Weather

EUROPE: Rain through the middle of next week will occur mostly in the eastern half of the region. Some rain will occur in the west; however, this will be much less and will not be enough to counter evaporation outside of southern Portugal and southern Spain. Rain in the east will raise topsoil moisture some more, which will be beneficial due to pockets of dryness that remain. More rain in the second week will likely be mostly favorable.

AUSTRALIA: Mostly favorable conditions are expected through the next seven days; however, greater drying will be needed in southeastern production areas. The long-term outlook for crop development remains good, but warmer temperatures would help with faster crop development and improved drying conditions. Some cooling is likely in the second week of the outlook.
