

Weather Report

09 November 2022

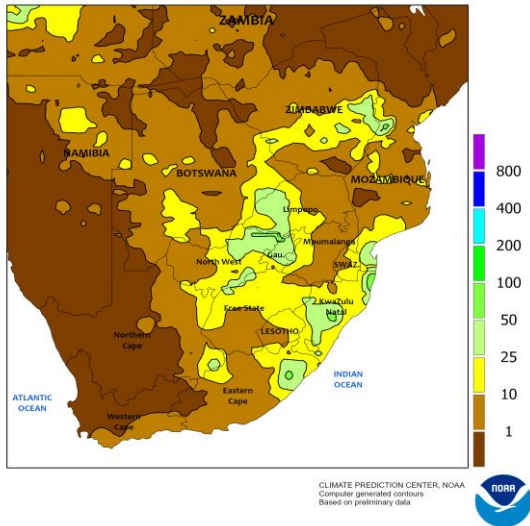

South Africa - Weather

SOUTH AFRICA: Eastern and central South Africa will have several opportunities for rain this week. The rain will further bolster soil moisture and maintain a good environment for summer grain, oilseed, cotton, and other crop establishment and growth. Planting may advance slowly at times in the wettest fields. Harvesting of winter wheat may also be sluggish in Free State.

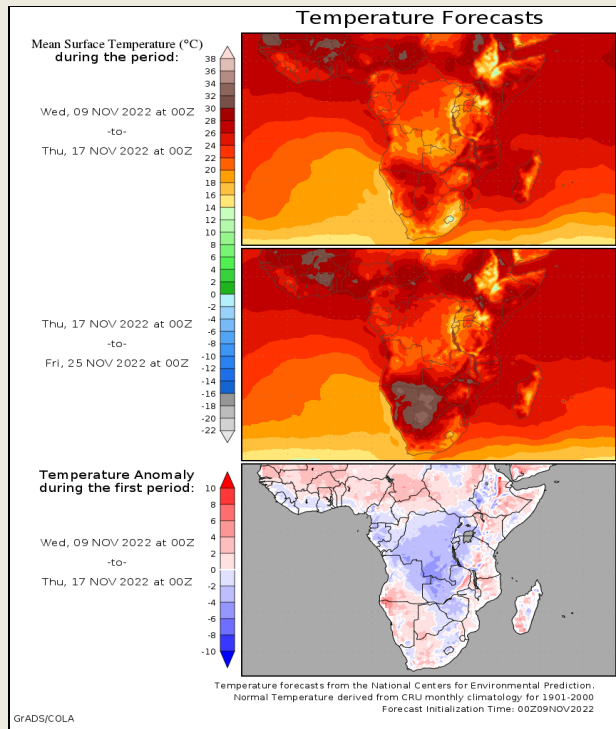

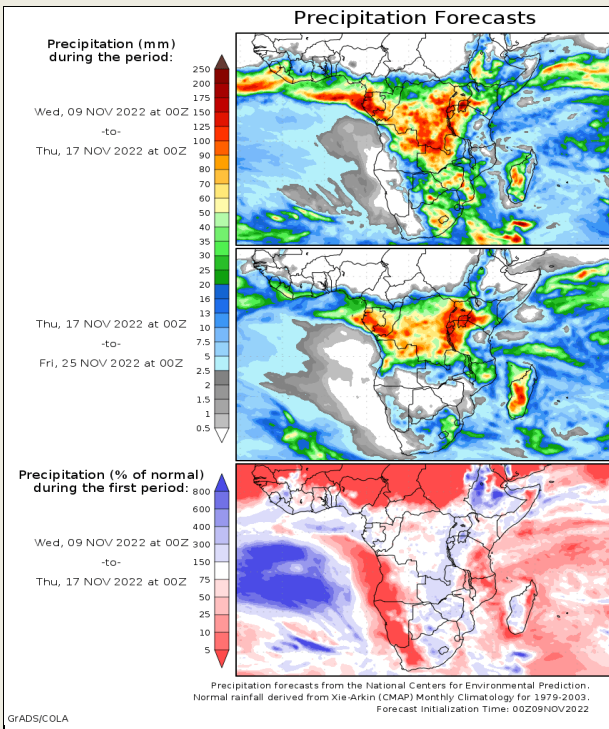

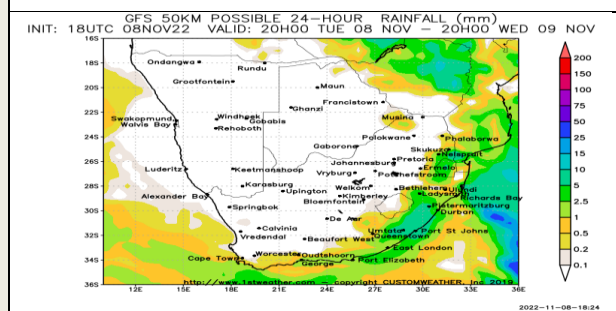

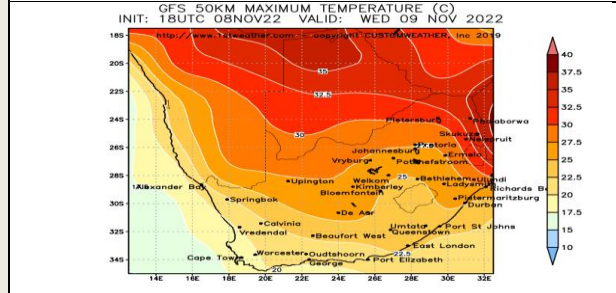

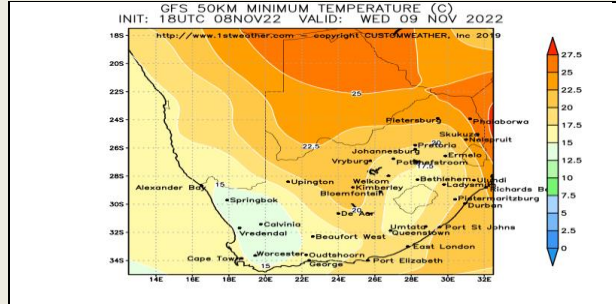

Western South Africa will be drier biased this week. The lack of rain will support a good environment for aggressive winter wheat harvesting. Eastern and central South Africa will see several waves of rain this week. Rain will evolve on a near daily basis.

- Moisture totals by next Monday morning will range from 1.50-5.00" with locally greater amounts
- Western South Africa will be drier biased this week
- Any rain that does occur will generally be lost to evaporation
- Eastern and central South Africa will again see a mix of rain and sunshine November 15 – 21
- Western South Africa will receive little to no rain

United States of America - Weather

U.S. MIDWEST: Late harvesting should advance well overall during the next two weeks although colder temperatures and a couple rounds of precipitation will slow fieldwork at times with significant rain and snow from the eastern Dakotas into Minnesota Tuesday into Friday likely to result in beneficial increases in soil moisture. The soil is likely dry enough that it should soak up the moisture Tuesday into Friday's rain and snowmelt without becoming excessively muddy and harvest delays should not become extended. Colder temperatures, however, will reduce drying rates and some extend delays to fieldwork in the wetter areas.

U.S. DELTA AND SOUTHEAST: The Delta and the Southeast will see a mostly restricted rainfall pattern through the next two weeks and harvesting should advance well overall around rain this evening into Saturday from the Delta to west-central and northern Alabama and rain from southeastern Georgia and nearby Florida to southern Virginia Tuesday into Thursday. Each round of rain will be beneficial for winter crops while causing mostly temporary interruptions to fieldwork along with some discoloration of cotton.

South America - Weather

BRAZIL: Little rain of significance is expected outside of parts of Minas Gerais and Bahia through Wednesday and summer crop planting and winter wheat harvesting should advance swiftly while concerns over dryness may increase for western, central, and southern Brazil and Paraguay. As long as timely rain Thursday through Nov. 12 and follow-up showers Nov. 13-18 occur as advertised most areas should be left with enough soil moisture to favorably support crop development.

ARGENTINA: Dry weather and good planting progress will be most common through the next two weeks with showers in the southwest Wednesday into Thursday and rain in much of the country Nov. 11-13 important for many western, central, and northern areas.

o The period of wetter weather Wednesday into Nov. 13 is not likely to result in enough rain to soak the soil in many areas and rain will be needed again soon in many locations.

Europe, New Zealand and Australia - Weather

EUROPE: A restricted precipitation pattern will continue today and Tuesday.

o However, some heavy rain will occur with isolated to scattered rain showers and thunderstorms over southeastern Spain into central Italy and into Bosnia, Montenegro, Albania and southern Serbia and Macedonia. Moisture totals will vary from 0.75 to 3.00 inches and locally more.

AUSTRALIA: Net drying through the next seven days will still be great for letting the topsoil dry down and for improving crop and field working conditions. Any rain that occurs will be erratic and much of the rain will be light. Temperatures will also continue to trend warmer. River and stream flooding will continue to slowly ease.

Rain is expected to increase in eastern production areas in the second week of the outlook. Significant fieldwork delays are unlikely, although this will be monitored.
