

Weather Report

20 March 2023

South Africa - Weather

SOUTH AFRICA : The main production areas in South Africa will see a mix of erratic rain and sunshine through the end of next week. The rain will be beneficial for the crops that are still in the development stages. Maturation conditions will also be mostly favorable despite the periods of rain. Early-season harvesting and general fieldwork may advance slowly at times due to the precipitation, though most producers will have opportunities to get into the fields between rain events. Much of South Africa will see a mix of erratic rain and sunshine through the end of next week. Light rain will initially be scattered across portions of southern and eastern South Africa today and Saturday. Two disturbances tracking near the country will promote more widespread rain Sunday and next week. Moisture totals by next Friday morning will range from 0.10-0.75" in most locations. Portions of Eastern Cape and southern Natal will receive 0.75-3.00" of rain while pockets in Northern Cape and Limpopo receive little to no rain. Periods of light rain will again evolve for South Africa March 25 – 31

United States of America - Weather

U.S. MIDWEST : Two rounds of well-organized precipitation will occur through late next week and although much of the precipitation will not be heavy, cool temperatures will limit drying rates and much of the region will be left with saturated soils and will be vulnerable to flooding if a heavy rain event were to occur soon. o The driest areas in and near northeastern Nebraska and northwestern Iowa should receive enough precipitation to induce beneficial increases in soil moisture. • The Red River Basin of the North will receive additional precipitation that will not be welcome as the added moisture in the snow pack will increase the potential for more significant flooding from snowmelt in the coming weeks.

U.S. DELTA : The Delta through central and northern Alabama will be mostly dry Saturday into Wednesday after rain today into Friday and fieldwork should increase. o The southern Delta will benefit from rain today into Friday. • Southern Alabama and northern Florida through eastern North Carolina will see two rounds of rain through Tuesday and fieldwork will be limited. • Nearly widespread rain is expected Mar. 23-24 across the Delta and the Southeast and fieldwork will be interrupted while the precipitation will induce additional increases in topsoil moisture in the southern Delta.

South America - Weather

BRAZIL: Paraguay and much of Brazil will receive enough rain during the next two weeks to slow fieldwork while maintaining or improving conditions for crop development with a few exceptions in the northeast and far south. Fieldwork will continue to advance around the showers and thunderstorms, but delays to soybean harvesting and Safrinha corn planting will extend deeper into the month which could reduce Safrinha corn production as yields are typically greatest if the crop is planted before the end of February.

ARGENTINA: Today's forecast is wetter than what was advertised Wednesday for the driest areas from Cordoba to Entre Rios Sunday into Wednesday and if rain falls as advertised late-planted crops will benefit from the moisture. Confidence for the exact placement of the greatest rain is low and some later adjustments may be needed, but at least some relief from dryness is expected. Relief from dryness should be temporary without follow-up rain and rain advertised for Mar. 26-29 could extend improvements in crop conditions into at least early April.

Europe, New Zealand and Australia - Weather

EUROPE : Precipitation will significantly increase in northern production areas in the first week of the outlook. Southern production areas will trend drier. Rain and some snow will occur in parts of the region daily through Sunday. The precipitation will be greatest and most frequent in the north. Total moisture will vary from: 1.00 to 4.00 inches in the northern half of the region to 0.50 inch in the southern half, locally more than 1.00 inch. Frequent precipitation will occur in the second week, March 13 – 20. The precipitation will be near to above average in most of the region.

AUSTRALIA : Eastern Australia is still not expected to receive much rain in the next two weeks which will lead to increasing crop stress in unirrigated fields again, although some areas in Queensland have received enough rain recently to support crops for a while. Some rain is expected mainly in New South Wales in the first week of the outlook; however, evaporation rates will be high due to unusually hot temperatures and net drying will occur despite the rain shower activity.
